Thread: [Calling my function?](#)

Jordy Clasie - June 10, 2013, 5:37 am

Hey guy's so i created a function call nameString, with the parameter placeholder called (name)

When i put my own name in the parameter it give me the following error

ReferenceError: kevin is not defined, but i define the parameter when i am calling the function.

```
Code var nameString = function (name) {  
    return "Hi, I am" + " " + name;  
};
```

```
nameString = kevin;
```

```
console.log (nameString);
```

Could anyone please help me out, i am a JS beginner but i am still getting more the hang of it.

?Alexander - June 10, 2013, 10:07 am

Try calling the function like this:

```
Code nameString(keven)
```

OR

```
nameString("Keven")
```

Not sure with or without ", been a long time since I used JS.

Thank's got it already and it is without the quotation marks.

Wrong section.

[Web Development](#)

@Anon

nameString("Keven"); is correct.

@OP

nameString = "Kevin"; should fix it. Otherwise it's looking for a variable called "Kevin"

PHP Code

```
<?php  
var x = "I_am_a_string";  
var I_am_a_string = x;  
console.log(I_am_a_string); //I_am_a_string
```

Works

PHP Code

```
<?php  
var x = I_am_a_string;  
console.log(x);
```

Does not work. You'd get an error like: "ReferenceError: kevin is not defined".
