Well lets see it took me 2-3 hours to make it, as well as weeks for the special parts to ship.

Did I mention it could light cigarettes? Or joints.

445nm, product is tested where module pieces were produced, I myself do not have a output chart.

GL1TCH3D - June 12, 2013, 7:24 pm

Focasable?

What module did you use for this?

Yes, uses a G2 lens as well. Can focus from 1mm out to straight beam as far as the eye can see.

The module is a 9mm Diode in a V4 Copper housing W/2.2A X-Drive

Unless you purchased from one of the few companies that sells legit diodes I'd recommend you get someone on lpf to verify the output, as diode sellers are notoriously unreliable.

Very true =/

That's why I'm skeptical about the true power output.

Those things are pretty big and bulky, although I love the host design.

This is a very unique host as well, but fits really well and has a nice weight to it. Also incredibly powerful for much less than an arctic laser.

200\$ is a fine price. You should add a link to some safety information, because when its so powerful as this, it's very important to wear protection glasses

You can burn thru plastic, scar a solid block of wood, light matches, hell it could even start a Bon fire

How many other Lasers have you built and/or sold ???

BTW 150% more powerful than a WL 1.4W Laser as you stated in Post #69 would make your Laser 3.5W...

I thought you were selling a 2W Laser ???

Since you said that YOU built the Laser... Why are you not aware that there is no IR filter required for a 445nm Laser Diode. There is NO IR emitted from a 445nm LD.

You will need to have the output verified on a calibrated Laser Power Meter to know the true output power of your Laser.

That is a 9mm multimode 445nm wavelength Laser Diode in your Laser.

At what current are you driving the Laser Diode ???

Are you using a Linear LD driver or a Boost LD Driver ???

A potential buyer would need to know.

Jerry

I lost interest because I'm happy enough with my current laser.

But to all other interested people: \$80 is very very cheap for a 2000mW laser. Even if it turned out to be some cheap fake diode (which doesn't seem to be the case) with a true output of let's say 1 Watt, \$80 would still be more than worth it.

Vouch for OP.

Yeah I've lit a cig with it before, a few times actually (when i couldn't find a lighter and didn't want to buy one).

I'll have to find some glasses so I can film myself doing it

Im selling it on here because I don't have a power output reader that I pretty much need to sell on LPF.
