Thread: [Sending Virus \(undetected\) \(Questions\)](#)

StarPlox - June 22, 2013, 3:25 pm

Hey, I made this thread today to ask users of HF how to bind a jpeg and a keylogger / Rat together so it can't be detected by anti-virus programs. If you can only do this with a crypter please leave a link leading me to one, and maybe some information on using a crypter would be helpful. I am aware that most crypter are patched pretty quickly that's why people make their own. But I do not know how to make one yet so yeah.

(Please answer to your best)

~ Thank you in advanced?

?pth?n - June 22, 2013, 4:01 pm

You are wrong with a few things. Binding doesn't change its detection rate.

A crypter is modifying the signatures of your server. This is what makes your server FUD (fully undetectable)

Most crypters are paid. Free Crypters get detected extremely fast, and are rarely FUD.

I suggest you investing money into a crypter license, you can find some in the marketplace.

Paid crypters get updated as soon as they are detected normally ;)

SW4T - June 22, 2013, 4:16 pm

You can purchase a Crypter in the Marketplace area.

Most crypters have built in Binders so you can bind your .exe with your .jpg

Note that changing your .exe file to a .jpg file will corrupt the .exe file not allowing it to run.

I Agree with everything you said (y)

-Cheakyjay ?

Thanks for all the Answers, I also wanted to ask how difficult it was to make a Crypter and what would I need, to start making it with c++?

Well first off you would need to be very good at Coding in the C++ language.

Making a crypter is not that hard, in fact, you can find a Crypter Blueprint on HF ;) You don't really need any language, because everything necessary is written in the Blueprint. It's about finding out which signatures got detected by an AV, and cypting them. The process is not that hard, however it can be very time consuming and boring.
