Thread: [\[Simple\] Updating System For Your Application](#)

The-One - April 10, 2010, 11:05 am

Okey, im posting this simple updating system I made.

What are we going to use?

Webclient

Label

If/Else

DownloadFile

Ok, in your program put:

Under Class Form1

Code Dim Version As String = "1.0"

Form1.Load

Code Label1.text = Version

Next, we need a host for our file, which we use, to upload the .exe and see if theres a update.

Upload a text file to your host with ONLY 2.0 in it.

Now lets check for a update.

Form1.Load // Buton1

Code Dim NewVersion As String

Dim WebC As New Webclient

Try

NewVersion = WebC.DownloadString("<linktoversion.txt>")

Catch ex As Exception

NewVersion = WebC.DownloadString("<linktoversion.txt>") ' Try again most of the times, if it doesnt connect the first time, it will now.

End Try

If NewVersion = Version Then

Label2.text = "No New Updates"

else

Label2.text = "New Update!"

End If

Ok, so now it checks if there is a update, you will need to update the text file every time you upload a new update.

Now lets make it download

Button2

Code Dim Webc As New Webclient

```
If Label2.text = "New Update!" Then
Webc.DownloadFile("<linktournewfile>", "<nameuwantittoget>")
Label2.text = "No New Updates"
End If
I fully wrote this myself, enjoy.
```
