? How to resolve Cloudflare Protected sites ?

? A tutorial by Tibal ?

Requirements -

1. CMD (Windows).
2. The website.
3. Internet access.

Method #1 -

(This methods exploits a exploit in Cloudflare, by default cloudflare leaves the subdomain ".direct" as a back up direct pathway to the server, if we ping it, we can obtain the main IP. Most knowledgeable web masters would have removed this DNS entry, but most haven't.)

1. Click start.
2. Type "run" and type enter. This new screen will pop up.
3. Type "cmd" and hit enter, a new black screen will pop up.
4. Now type inside the CMD box, "ping direct.YOURDOMAIN.com", replace "YOURDOMAIN.COM" with the website you want to resolve, and press enter.
5. If the IP is displayed then you have resolved the IP, if there is no IP or you get a error message, it's most likely been patched by the website.

Method #2 -

(Most websites keep their mail servers on the same server, we can exploit this by finding the mail server's IP which is the same IP as the website, since its hosted on the same server. A lot of the larger websites will though, keep their mail servers seprate from the main server. This method may not work for everyone.)

1. Head over to [HERE](#).
2. Type in the website you want to resolve.
3. In this case, we attempted to resolve Hackforums, and got this IP.
