Thread: [DarkComet Only one usage of each socket address\(protocol/network address/port\) Error?](#)

Bot Products - July 22, 2013, 4:40 am

My DC was working fine yesterday, now today I open my computer, open DC and get this error:

Only one usage of each socket address(protocol/network address/port) is normally permitted.

I used the port checker tool and 1604 is NOT forwarded? I don't know what happened. I logged in to my router and port 1604 IS forwarded.

Could someone tell me a working fix?

Understalker - July 22, 2013, 4:41 am

I can help you over TV if you'd like.

Thanks for the offer, but I just found a working fix for everyone.

Simply re-portforward, delete your DC listener and add it again. Then it'll work. :)

Hey guys, this is my first reply ever on this forum! I've downloaded darkcomet and attempted to listen to a new port, but I keep getting the same error.

"only one usage of each socket address (protocol/network address/port) is normally permitted"

I have not port-forwarded because my router has a issue (so i can't get my default gateway info). So I have been trying to use utorrent, going to preferences and setting the router to 1604. But anyways, I can't listen in on darkcomet, and I'm pretty new to hacking.

Any help would be greatly appreciated! ?

My very first comment too, yay.

If I were you I'd stay the hell out of this shit if you don't know how internet works ^^

(Mar 11, 2014 09:50 PM)Frostix Wrote: [\[CITE\]](#) You can only use one port at a time. So if you have any other applications listening to it, it won't function properly. Alternatively you can simply use another port for each application.

Hmmmm...I've tried a bunch of random ports and the same error pops up every time):

Any idea why this might be happening?

Ok by the way, I have PFPortChecker and I check my port. It my port is open. I closed the program and tried to listen in on that port on darkcomet and it didn't work.

(Mar 12, 2014 09:44 PM)Frostix Wrote: [\[CITE\]](#) That's why. The port only needs to be running on DarkComet and you can check if it's open at [this site](#).

Oh, thanks for the link! And I'm still stumped (probably because I'm new to using ports and all). I closed all my programs and made sure there definitely wasn't any programs on the port 1604. Then I tried it and got the same error. It's not only that port, but it hasn't worked on any port):

Oh nevermind! I figured it out finally! Dang, that took me a while. Thanks for the advice man!
