Thread: [How to get iDevice Info in VB.net/C#](#)

1MagnusTSR - July 24, 2013, 1:18 am

Hey, this is my first tutorial here, but I'm not going to go through the ENTIRE thing, I'm just going to give you a major understanding..

Getting Device Name:

OK, so you may have seen on jailbreak programs, ect. It can display your iDevice's name. This is done by getting the USB name.. Since the cord acts as a USB, and the iPhone is connected, it is technically the storage in this case. So for this, all you need is to be able to get the USB name inside a label or whatever you want.. [Easy]

Adding a Jailbreak System:

OK, so for this you will need a copy of Cydia and a few extra iPhone Jailbreak files.. (Search for them or decompile an existing jailbreak program and take those :)) and Save/Overwrite the Files onto the USB(iDevice) [Hard]

Getting Storage Usage Stats:

Like I said before, this iDevice acts as a USB. Just get the USB storage to show in your program. [Easy]

Like I said, this is just to give you a better understanding on how to do these types of programs. I hope you enjoyed :)/align]

If you need more on this, I can help. There is easily a way to grab iDevice info using the AppleMobileDevice.dll or whatever it is. If anyone wants specific help, feel free to PM me.
