Thread: [IPBite - Find anybody's IP - Discover the hidden](#)

LetsCodeThis - August 18, 2013, 9:14 am

I've created this site myself from scratch, I hope you guys enjoy it (:
Contact me on skype if you want to discuss anything: Billy.rammal

[img]http://s17.postimg.org/lnf6cwmb3/logo.png[/img]

We are currently in BETA so please report any problems via my skype. Also, temporary domain name.

Website: <http://wecode.net78.net/>

With IPBite you are able to create your own personalized IP-tracking page which logs all visited ip addresses. This is very useful when trying to find somebody's IP address, being completely legal. We are also developing many other tools such as a url mask to hide your url and make the url appear completely different, allowing you to trick even the most computer-savy of victims.

Its alright, ill be getting that taken off. Also, ill be making a script for the pages to be hosted on many different domains so it'll be much more convincing.

I don't know but I would consider this a bug:

[img]http://arehost.net:9090/photo_share/318250932.jpg[/img]

1. I already explained that Google incorrectly marked the site as a phishing site after automatically crawling it and that I am talking with them to remove this.

2. This site isn't about "hacking", it's a valuable tool. You don't need to be a "real" hacker to know how to md5 hash something.

3. All passwords on the site are hashed, bloated, hashed again, added a unique 64 digit salt, etc. For all I care, use my admin account (doesn't have special privileges anyway). Accounts are just used to identify a user's pages created, IPs tracked, etc. Stop hating.

I was not hating I just was showing you what it said for me. The site seems ok to me but I don't think you can exactly say it is not for "hacking." I personally think your problem may be the host you are using, that is probably why Google flagged you. Never the less this was a automated decision Google is not singling you out. Nice site but the idea is way overused.

Thanks, I thought you were hating. I've only seen the idea on one other site, which is much less sophisticated and offers many less features, being also much less reliable because of it's use of mail() instead of much more complex database storage that I'm using.
