Thread: [Global Hell I Help Desk Answering All Hacking Questions I And General](#)

IIII Global IIII - August 28, 2013, 4:03 pm

I Information About Help Desk I

Global Hell here we have decide to open a Help Desk.
Were you can ask any Question that you need answered.
We will answer your Question to the best of our knowledge.
If we don't know the answer we will hunt for that answer and get back to you right away.
Also any Member of Global Hell can answer your Question in here.
Don't be embarrassed about your Question either we all started out as beginners.

I Warning I

Do Not Via PM

Spam Posting Will Be Reported

\$lick - August 28, 2013, 4:08 pm

Does a circle have sides ?

If so my theory on life is over :(

IIII Global IIII - August 28, 2013, 5:22 pm

We are currently all online so feel free to leave us a Question for us to answer Thanks

NeymarS - August 28, 2013, 5:52 pm

Are you able to crypt my DC file for free? Thanks in advance.

-Ney

rfz777 - August 28, 2013, 5:55 pm

Nobody will crypt for free. That has nothing to do with a question for a helpdesk. A question would be something like "Help me setup dcrat"

mudasir007 - August 28, 2013, 6:15 pm

Hello, This question is about networking, if i am using broadband service does isp side still use radius protocol for my authentication and accounting, what distribution of linux i should use to implement it at my home.

IIII Global IIII - August 28, 2013, 6:25 pm

Awesome Group! I've been a member for a bit and everyone's super nice and helpful to each other!

3.14 - August 28, 2013, 8:20 pm

Dont be afraid to ask us ANYTHING. We love to help

ThatAsian - August 28, 2013, 8:43 pm

I'm not really sure if this is a hacking question but whatever. So is it true that on Facebook people can find out all of your information through a photo? Like family, address, phone? I know it sounds ridiculous but yeah. If so WHAT AND HOW. Thanks for the help or sorry for this not being a hacking question.

Terry A. Davis - August 28, 2013, 8:59 pm

I have set up a rat and the port 80 says it is open yet I do not get any slaves.

This is a question of networking and ratting not a real scenario.

?Starfire? - August 28, 2013, 9:02 pm

I'm not 100% sure if they can if its through facebook because I think they might remove it from your pictures when uploaded.

But there is something when you take a picture on certain devices with GPS enabled software it will record something called exif data, Which will tell information about the photo like where it was taken by what kind of camera and etc.

This site should help you in your quest to stalk people! Just insert the picture you want the EXIF data of and if there is any it will tell you all there is to know :)

Spoiler ([Click to View](http://exifdata.com/))<http://exifdata.com/>

Terry A. Davis - August 28, 2013, 9:04 pm

I've had cases of it being removed and others or not, so to add to this, some things you can do are take a screen shot of the photo using gyazo and send them that or use the exifdata remover tool shown above

?Starfire? Wrote: I'm not 100% sure if they can if its through facebook because I think they might remove it from your pictures when uploaded.

But if you already have Facebook account and have friends You Practically have half of their information right there

depending whether their profile is public or not. If it is then that's a good thing, because now you know the person's full name, city, state, and even their email and phone number if they have that shown in public as well! If their information is not shown in public then just use a fake account and send him/her a friend request, and wait until he/she accepts it. If the information is still private, you can try sending some of her friends some requests and try to social engineer them into giving them a decent amount of information. Or you can just look through their friends list, and hopefully find their parents in it, and you can easily be able to get their address, since

their parents are in the system, you can find them throughout <http://whitepages.com/> , <http://411.com/> , etc

We are always glad to help that is what we are here for :)

celliottize - August 28, 2013, 9:30 pm

Hey,

So at my school, we are given laptops. Our system Admin has a server, where he has provided us all domain logins (for example, our domain is "TOLTON" the name of our school) and so my login is TOLTON\celliott. I have gained administrative rights on my LOCAL login on my laptop. The admin knows this, and since it's not on the domain he doesn't care. My goal is to install some logger that will log HIS ADMIN PASSWORD if I ask him to connect my computer to the domain. Regular loggers don't log things like admin logins, because of some windows thing. How can I log it? Please help, would be super appreciated.

Speedophile - August 28, 2013, 9:44 pm

Can you recommend a booter that has enough power to boot someone offline? Willing to pay but free would be better.

Also, If i try booting A port: 80 will that make any difference to if i try and boot port: 3074 (Xbox)

Like, what's the difference between 80 and 3074 apart from 3074 being the xbox port, thanks:)

III Global III - August 28, 2013, 9:46 pm

Hi Guys,

Thanks for this thread.

I need a site to be hacked so that i can get into premium section of site.

I found that the site is in ip which has hosted around 20 other sites.

So what are the ways in which i can get into to the site?

Thanks

Hello fellow Hf member!

I understand completely what you would like to do! But here is an easier way to get your admin to give you his password with out him even knowing that you have his password! check out this video i have learned from about a year ago! works like a charm in situations like yours!

[Video: <http://www.youtube.com/watch?v=RyQL9AdxHqY>]

Run a virus scan and remove it? Hard reset your PC, and reinstall your OS.

Disgruntled3lf - August 29, 2013, 2:56 pm

This has its own thread. But I have a database that is storing password hashes as varbinary(64). It looks like this:

```
0x3DA1EE806AEFAC5935448D0314C6F8F2A81B94A6EC638107214F6220FF8A9C53CBD6B4C
A44D9E9D7207E53084EAD5476887EBDF2EBECDC867F2DA6C916B465B9
```

How do I make that back into a hash I can work with. The algorithm used to hash the password should be SHA256.

More information here: <https://hackforums.net/showthread.php?tid=3723059>

rfz777 - August 29, 2013, 3:06 pm

It may just be hexdata, not even a hash. That's definitely not binary.

Disgruntled3lf - August 29, 2013, 3:15 pm

Some SQL servers display binary data as its hex equivalent. That's what this is. I should be able to use the CAST or CONVERT functions to transform it back into the original hash. But I get a string of numbers instead of what is above.

rfz777 - August 29, 2013, 3:17 pm

I'm not sure how to help then. I've never worked with an SQL server like this.

GrizzlyHackz - August 29, 2013, 3:17 pm

Hi i was sent here by members only and i would like to learn some stuff would someone plsss help me PM me

?

Thank you very much!

Unfortunately, this only helps crack local hashed passwords, not say, a domain admin password entered to join my computer to the domain, which is the issue in my case. I am familiar with Cain & Able, and it's great, but I don't think it can help here. Any other advice? Thanks for your quick response though, love the positivity

hoodriich - August 29, 2013, 9:50 pm

did you see my post about brute forcing the admin account?

cellriottize - August 30, 2013, 6:54 am

(Aug 29, 2013 10:58 PM)Brentbmwh Wrote: [\[CITE\]](#) did you see my post about brute forcing the admin account?

What would I need to connect to via remote desktop? I KNOW I can't connect to the server itself, that requires the admin password that I'm looking for. Also, if it helps, I know the characters in the password, as I've seen our admin type it in. Unfortunately, I've tried guessing it before, to know avail. If I could brute force it, I could set the params to only include the letters and symbols I know are in it, increasing my chances and shortening the cracking time, correct?

rfz777 - August 30, 2013, 6:57 am

Yeah, you could narrow down the password list to increase your chances of successfully bruteforcing.

cellriottize - August 30, 2013, 7:13 am
