Thread: [Jabber/pidigen html exploit founded](#)

?Sakura? - September 4, 2013, 5:59 pm

I remember the old exploit with skype where you can have something like: google.com and it redirects to your.exploit.com using html text edit(They patched this in the new skype updates last year but still possible to do it with old skype but vulnerable from the spam exploit). I found something like this with the pidigen client

Well I am not sure if this is old or something but it would be useful for spreading or pranks like sending hackforums.net/thread --> to a porn site

Well I am not exactly sure how I can do this but when I post a text such as:

<https://gyazo.com/a8001f98bc9d1698cbc76701b2783e40> <-look at the N

When I click N it will redirect me to a tumblr page(Its a hyperlink like the one above)

Now as you know pidigen can sign in via Facebook. So probably works for Facebook(Or you do pranks / spread via facebook)

So I am not sure if this was found or something but I am going to spread it to you guys to play with

This is my idea:

Lets say facebook ok?

Have an exploit pack

Then have a legit twitter or someshit account.

Ask someone on facebook to check out your twitter. What it would do is when they click, it would go to your exploit pack, then your exploit will redirect to your legit twitter. Then profit

If you have lets say "hacked" facebook, be like check out my new twitter!!! = Profit wut now son
