Thread: [Official jRAT Setup Tutorial | Port Forwarding | Noob Friendly | Troubleshooting](#)

Business - September 7, 2013, 9:15 pm

This guide is designed to assist anyone setting up jRAT4. It is easy to follow, so anyone can use it!

Before we begin, you will need to download jRAT4. You can download a trial version from the official site, and you can purchase the full version by clicking [here](#).

The full version comes with a keylogger plugin, and a webcam plugin. It also removes the limitations that the trial has. You will have complete access to jRAT.

Official site to download the trial version:

<http://jrat.pro/>

We also need to set up No-Ip.

[No-Ip site](#)

Next thing we need to do is make an account.

In the top right of the homepage it should say "Sign Up".

Once you click it, you will be presented a page that looks like this.

Proceed to fill out the Username, Password, and Email with your information.

When you reach "Hostname", stop.

Your hostname is what you will use as your IP when making your file in jRAT4.

I suggest making your hostname something you will remember.

At the bottom of the page you will be asked to choose between "Get Enhanced", and "Sign up". Choose "Sign up".

You will now be directed to a page that looks like this:

At this time you must go into your email and click on the verification link that was sent to you.

After you click it, you will be prompted to sign in.

Once you have signed in, you will be greeted by this page:

Once you are on this page, on the very right, it should say "Manage Hosts". Select this option now.

On the next page, you should have a host already there.

This is the hostname we made when we signed up.

To the right of your hostname it should say "Modify". Select "Modify" and continue on to the next page.

On the next page there should be some settings.

Check to see that your host type is "DNS Host (A)".

Verify that your IP is correct where it says "IP Address".

You can check your IP at the site below.

[Check IP Here.](#)

Once you have verified these settings, scroll to the bottom of the page and hit "Update Host".

You will be redirected back to your No-IP home page.

You should be welcomed with a message saying that your host was updated.

We are now finished with our No-IP setup.

Our No-IP hostname will assist us in making our file in jRAT4 later.

Further Explanation will be provided in that section.

Business - *September 7, 2013, 9:16 pm*

Once you have downloaded jRAT4, create a file on your desktop named "jRAT4", for easy access.

Now, we will extract the downloaded .zip file to our new folder.

You should now have a folder that looks like this:

To run jRAT, open the "Client" file. It is a .jar located in our new folder:

Once opened, you will be prompted by some notifications:

Click yes.

Click continue.

Click yes.

These notifications can be turned off, but I keep them on.

Once you are done with the pop ups, you will be brought to the client:

First thing we must do is go to to the server module, and generate an encryption key. We will be using the advanced builder for the purpose of this tutorial.

Go to: Main > Server Module > Advanced Builder

Now, click the key generating key several times:

Now copy your key, then minimize the advanced builder.

Go back to the client, and click the "Sockets" tab:

Now, right click and select "Add Socket":

Once at this screen, change the port to "1604", because that is what we will be using for the sake of this tutorial. (You can use many ports)

Now, under pass, simply write "pass":

For the key section, paste your key that you generated from the advanced builder:

If the key is valid, the box will turn green.

Now, simply press "Listen":

Once this is done, you will need to see if your port is open. Head over to <http://canyouseeme.org/> to check if it is. If not, you will need to port forward.

The first thing you are going to need to do is figure out what your Default Gateway is.

You can do this by going into your Command Prompt.

I am a Windows User, so this guide will be based off of Windows instructions.

The steps may be partially different for other Operating Systems.

To find your Command Prompt, click the start button located, usually at the bottom left corner of your computer screen.

Once you have clicked it, type "cmd".

A black screen should pop up.

This is your Command Prompt. Next you need to type "ipconfig".

This will present you with your connection information.

Your screen should now look something like this. (Example pic)

If you do not see where it says "Default Gateway", you may have to scroll up or down.

Once you have found it, minimize this for now.

Next you need to open your Internet Browser.

I personally use Google Chrome.

Now you must enter the Default Gateway that you found in the Command Prompt into your Address Bar.

Mine is 192.168.1.1, so that is what I entered into my Address Bar.

Click Enter. You may be welcomed by a prompt asking you for a User Name and Password.

In this case, unless your User Name and Password are customized by you or someone else, than you should be able to find them on the website below.

The website will ask you for the brand and model of your router.

To find what model router you have, you can check on the router itself.

It should be listed as "Model No.", or something similar, somewhere on your router.

[Router list.](#)

All you have to do is enter what brand and model you have, and it will come up!

Once you have found and entered your User name and Password, you should be brought to your router's homepage.

These vary in style according to your router brand. Mine looks like this:

The methods to port forwarding are different based on what router you have.

On mine, you go to "Applications and Gaming".

Seeing that I can only demonstrate how to do it on my router, I will provide a website with instructions on how to port forward on each router.

Make sure to follow the directions for your router precisely and completely.

When it gives you the option to select "Protocol", you will have either two or three options.

If you get two options, they will be "UDP", and "TCP".

If you get three options, they will be "UDP", "TCP", and "UDP/TCP".

Sometimes instead of the option "UDP/TCP", it will say "Both".

You need to select "UDP/TCP", or "Both".

When you are filling out the IP Address, you will use your IPv4 Address.

You can find this by going back into your Command Prompt and typing "ipconfig".

It should be located around the same area that you found your Default Gateway.

This is what my port forwarding looks like:

Once you are done, Hit "Save Settings", or a button similar to this, which you will find somewhere on the page, commonly towards the bottom of the page.

To test if you have successfully forwarded your ports, you can use this site.

[Test here.](#)

Go to this site, and type in your port where it says "What Port?"

If you were successful, you should automatically load this:

If your port(s) were not successfully forwarded, you will get this:

(I chose a random port that I knew was not forwarded.)

If you DID get this error, DO NOT WORRY! There are many things that keep ports from forwarding.

Business - September 7, 2013, 9:21 pm

Port Forward Troubleshooting:

The most common problem I see people having with Port Forwarding is Windows Firewall.

You can find this by either going to “Start”, and searching “Windows Firewall”, or by going to your Control Panel.

When you select Windows Firewall, you will see a page that looks like this:

The first thing you need to do is locate “Turn Windows Firewall on or off”.

This can be found on the left side, in the middle. Click on it now.

You need to make sure none of the boxes are checked and that all options are set to off.

After you do this, the places on your screen that were once green, should now be red.

This is where the most common mistake comes in. Most people think that Windows Firewall is now completely off.

It is NOT! See where it says “Block all connections including programs on the list of allowed programs”?

You need to fix this.

The next thing you must do is find where it says “Advanced settings”.

Once you click it, you will be brought to this page:

You will notice that it still says “Windows Firewall is on.”

For your next step, click “Windows Firewall Properties”.

A pop-up will appear:

You need to change where it says “Block”, to “Allow”.

After you change it to “Allow”, change the firewall state to “Off”.

Do this for all three tabs.

Once you have done this for all three tabs, press “Apply” at the bottom. Then press “OK”.

Where it previously said “Block all connections including programs on the list of allowed programs”, it should now say “Allow all connections that do not have an exception to block the connection”.

Now that you have completely and successfully disabled Windows Firewall, you can test to see if you ports forwarded once again:

[Test here.](#)

Still having problems?

You may have a firewall enabled on your router itself.

Go back to the router homepage that we opened earlier and go to “Security”.

Most router homepages will have that section.

Look for any firewall settings and make sure they are off.

If you are on a wired connection, and cannot manage to open your ports, I suggest buying a VPN that supports port forwarding.

For this, I HIGHLY recommend BlackShades VPN.

You can find it here:

[BlackShades VPN](#)

This VPN is also great for staying anonymous while ratting.

Many of you will find it a good idea to run a VPN.

The reason I suggest this particular VPN is due to the fact that it opens ports for you.

Easy to use and good for your purpose.

For more information on this VPN, please visit this link:

[BlackShades VPN Thread](#)

Now that your port (1604) is open, we can continue.

The next step is to create our stub.

Head back to the advanced builder, and we will continue.

Once there, click on "Network":

Now, click the second box next to IP:

Enter your No-Ip hostname here:

Now, change the port to 1604, because that is the port we chose to use:

For this tutorial, I am using the settings that I prefer to use. The rest of them are already filled out. They are the default settings for jRAT4. If you have the full version, use the directions you were given when adding the plugins.

Head to the "Final" tab:

Click the folder icon, and name your file, then choose where you want to save it.

Now click "Build":

You will receive a confirmation screen, verifying that you created your file.

You have now successfully created your jRAT4 stub.

To test your stub, we will use Sandboxie.

Download it here: [Sandboxie](#)

Once you have it downloaded, open "Sandboxie Control":

Drag your file into the Sandboxie control window, and you will be prompted by this:

Make sure that "Default Box" is selected, and press "OK".

If you did everything correctly, when you run the file in Sandboxie, you should receive a connection in jRAT4!

I hope that this tutorial helped you, and feel free to contact me for further assistance!

clark.dll - September 7, 2013, 9:29 pm

There's so much detail and work included in this tutorial. Excellent job Business, more tutorials should include this much effort.

Skitz - September 7, 2013, 9:29 pm

Great tutorial! Once again, Thanks business.!

Preev - September 7, 2013, 10:04 pm

Brilliant great guide, bookmarking this nw,i will pm u or ask for ur skype if i need any further help. Thanks bud,

InfiniteExposure - September 7, 2013, 10:14 pm

great guide, def. saving for later.

CRT - September 8, 2013, 5:42 am

Great tutorial as always Business. Keep it up dude!

Amount - September 8, 2013, 5:43 am

What is the difference from the paid rat, and the trial rat?

Business - September 8, 2013, 5:45 am

With the limited version, you can only have five connections, and your victims will all see the jRAT4 logo in their active tray.

You also get the keylogger and webcam plugins, which work on any OS running Java, including Mac!

andi2690 - September 8, 2013, 5:52 am

good job nice tutorial :)

thank you for that

Amount - September 8, 2013, 5:57 am

And no crypting need, with the jRAT? Is it automatic crypted?

Business - September 8, 2013, 6:00 am

It is automatically FUD. If a detection occurs, we update with a refud within 24 hours.

redpois0n - September 8, 2013, 6:01 am

Glad that we got an official tutorial out.

Xyzo - September 8, 2013, 8:13 am

This is a great tutorial! I might gonna buy jRAT soon.

felanifelani - September 8, 2013, 2:50 pm

when i try no-ip host to connect to my victims i keep getting "eofexception" timeout error. but when i

try server in lan its ok

Business - September 8, 2013, 2:51 pm

Make sure your encryption key and password match for the socket and stub. When adding your No-Ip hostname, make sure to click the second box.

felanifelani - September 8, 2013, 3:08 pm

im sure that my no-ip host and socket settings are correct, the victim is trying to connect to me, but i keep getting EOFException error

Business - September 8, 2013, 4:15 pm

With all do respect, if they were correct, it would be working. I can help when I get home.

jackbaur57 - September 8, 2013, 5:16 pm

i just tried out the limited version no wand i will buy the pay version today but the guy that was putting me thru the setting thru team viewer and he said that i dont need VPN to port forward that i will be losing my slaves as the ip is changing even though i am using no-ip.. With my vpn the rat is port forwarding and if i am using it is not forwarding.. pls explain better to me and can i use the crypter that i brought with ? just asking

sorry 4 my bad grammer.. what i want to ask is will i lose my slaves when i use VPN with NO-IP? bcoS i cant port forward without vpn and if i used the VPN is auto port fowarding itself and i was told that i will be losing slaves as the IP is changing... And can i be using the brought crypter with it? Nice joy .. Thanks 4 the tutorial boss

Business - September 8, 2013, 5:46 pm

I think he was telling you that your VPN was changing your IP every time you connected to to it... not sure. I am sure that if you follow a port forwarding guide you will fix your problem.

You do not need a crypter at all for jRAT4.

Dexter ? - September 8, 2013, 9:39 pm

High quality thread as always Business.

Amount - September 9, 2013, 8:18 am

When i listen to a port, and i check it (the port is open) i get this message from JRat.

45070 disconnected: EOFException null

How to fix this?

Business - September 9, 2013, 8:24 am

If when checking the port on canyouseeme.org, you get an error, it worked.

Amount - September 9, 2013, 8:26 am

(Sep 9, 2013 08:24 AM)Business. Wrote: [\[CITE\]](#) If when checking the port on canyouseeme.org, you get an error, it worked.But it is nothing fault? Or is it that?

Business - September 9, 2013, 9:42 am

Thats means that jRAT is successfully listening to that port.

Amount - September 9, 2013, 11:46 am

As i test my server with Sandboxie, i get the error:

Server (my ip) /49617 disconnected SocketException: Socket Closed

How to fix this?

Business - September 9, 2013, 2:44 pm

Check that your password and encryption key is the same on the stub and the socket.

charlysmith - September 10, 2013, 2:39 am

very good, i buy this RAT immediately !!!!

Amount - September 10, 2013, 4:35 am

(Sep 9, 2013 02:44 PM)Business. Wrote: [\[CITE\]](#) Check that your password and encryption key is the same on the stub and the socket.

Is exactly the same, and i dont know how to fix this.

Business - September 10, 2013, 4:50 am

Make sure that your port is forwarded correctly.

moimoi14 - September 11, 2013, 1:18 pm

Hey, i cant use the webcam plugin? :) It just says unknown were there should be like : "1.3M webcam" or something. And i have 14 different slaves? :/

I have the paid version :)

Business - September 12, 2013, 10:48 pm

Did you add the webcam when building your stub?

moimoi14 - September 13, 2013, 12:47 am

(Sep 12, 2013 10:48 PM)Business. Wrote: [\[CITE\]](#) Did you add the webcam when building your stub? God dammit :D did not see the check boxes in Build-Sever/plugins
Thanks.

habberlabber - September 13, 2013, 2:41 am

Great tutorial, explains every detail!

Business - September 13, 2013, 4:59 am

Once again, thanks for the kind words everyone.

kammi321 - September 13, 2013, 5:09 am

I can vouch for business because his tutorial worked for me %100 and i am finally using Jrat. He is a nice and very helpful member and always offering free help without asking for anything in return.

Business - September 13, 2013, 6:43 am

I am glad to see that you got this working without problems!

Rielen - September 13, 2013, 9:36 am

(Sep 13, 2013 06:43 AM)Business. Wrote: [\[CITE\]](#) I am glad to see that you got this working without problems!

Im curious, with the BlackShades VPN they said

"Blackshades VPN prohibits the use of:

UCE (Unsolicited commercial e-mail)

Any kind of Trademark, Copyright, or patent infringement.

P2P (torrent) traffic (only when using US based servers)

Hacking/cracking, exploiting, port scanning and similar activities

Spreading Internet viruses, worms etc.
Any illegal activities under US/international law

Violating any of these terms may result in a permanent suspension of your account, and in special cases even lead to us contacting your authorities.

Please, use our service with caution, and keep in mind that the purpose of this VPN service is to provide maximum security and anonymity."

Now if im using this with a rat.. how will that affect me? =\
Just curious is all.. kind of worried about my own security when im not 100% sure i can trust the people who know my ip.

Edit: Mainly cause i do download torrents.. mainly movies for me and my girlfriend..
Also ive never tried ratting before or any type of hacking and thought itd be a good learning experience to try infecting a handful of people to see what its like.

redpois0n - September 13, 2013, 12:17 pm

They wont care if you RAT with their VPN. I promise you that.

~X.x.X~ - September 13, 2013, 12:21 pm

Man i m tired of port forwarding.

i can't forward a single one. :-(

i want to use trial for check...

Business - September 13, 2013, 1:17 pm

Try using a VPN if you really can not forward your ports.

psparrow3 - September 14, 2013, 1:31 pm

Hi,

I can't get a server running for testing purposes on another PC.

The port is forwarded and I can see a pop up on the jRAT when checking if the port is open, however I don't get connections from the server that is on a diferent network.

I've enabled the icon on the server to ensure it's running but nothing...

Any sugestion?

DWM - September 15, 2013, 5:14 am

Great tutorial business but nothing work for me ...

denoo9 - September 15, 2013, 7:45 am

This guide is useless, it not works, i dont get my slaves and its keep logging and logging, and when I asked for help, he just saying go after this guide, and nothing more. Omg.

Business - September 15, 2013, 7:49 am

You are rude, and I do not help rude people. I am not your worker. You are my customer, and if you do not want to hear what I have to say, and listen to this extremely helpful guide, I can not do anything else for you. Do not throw Team Viewer info at me either. I only help those who try themselves first. How are you testing your file? On yourself?

MMXX1 - September 15, 2013, 7:51 am

Great tutorial ^^ i am thinking about buying that rat.

denoo9 - September 15, 2013, 9:01 am

(Sep 15, 2013 07:49 AM)Business. Wrote: [\[CITE\]](#) You are rude, and I do not help rude people. I am not your worker. I only help those who try themselves first. How are you testing your file? On yourself?

So are you saying extremely helpful guide?

How the bzzz is that a step by step guide? YOU gaved me two files, i dont know when i need to extract these files into jRat, after starting it first time, or before starting, I DONT see what to do with the key, when i need to put it, there is nothing in this guide, this guide will help to users which NOT paid for the product, but i PAID i got another extra files, and you DO NOT have tutorial for how to setup that extra files, DONT post the youtube short video, there is nothing said in that video, its just extracting the files onto the plugins folder, but there is not said what to do after. Also i said you i removed the jRat many times, now i dont have the key, it isnt supposed to work with the key only???

Business - September 15, 2013, 9:05 am

You PMd me, and I gave you this tutorial, a video tutorial, and I guided you with messages, You refuse to listen.

denoo9 - September 15, 2013, 9:06 am

I listened, i tried to navigate by this so much awesome guide 13x times, nothing worked, and now my Client.jar even not opening, after i put the two files into plugin folder. So where is problem? :)

Business - September 15, 2013, 9:08 am

You are not following the guide correctly. I also told you, if you feel like you can not figure it out, contact redpois0n.

denoo9 - September 15, 2013, 9:12 am

Im wondering when you will get teamviewer fixed, many users waits for you so well help in the thread and you just waiting.

You could download any other version of Teamviewer, portable etc there are many options how to fix TV.

Business - September 15, 2013, 9:15 am

My Team Viewer was fixed today. You will not receive my help due to your rudeness on our PMs. Contact me if you want a refund. I do not like dealing with rude customers.

denoo9 - September 15, 2013, 9:17 am

I wasnt, you just keep responding me in PM's like an automatic robot response, telling me again to use a tutorial, which i used many many times, exactly step by step, and it not worked. I dont know whats your problem. Just help me and ill be happy.

Business - September 16, 2013, 7:21 pm

For any questions regarding jRAT4, and for further support, please submit a ticket on our site:

<http://jrat.pro/support.php>

very nice tut. Love the pcitures to your text. Explains everything ! Thank you so much =)

sandra1 - September 27, 2013, 2:14 am

hello.

i am testing the original limited version of jrat. was trying the server on several windows os. at first i was always needed to install java on the computer. it seems that in most cases java is not installed on windows.

also after installation of java, i always need to use a batch file(java -jar Client.jar or java -jar server.jar). to run the server or the client. otherwise they will not run.

also after running the JAR i always get a cmd window open.

i was wondering is these problems happens also on this version and how do you solve it? because that means the jrat will not run on most windows.

philosofa - September 29, 2013, 2:53 am

Hello,

I purchased jRAT, it is activated right now, but I am still unable to browse/see any plugin (via Main/Browse Pulgins). It opens a new windows without showing any plugin. What do i have to do now ?

redpois0n - September 29, 2013, 3:15 am

Ask any questions on this thread.

Dagh0st - October 25, 2013, 9:06 pm

since i dont have a rep to post in Red's post ill post here.

Red said something about a update to FUD JRat and only paid customers would receive this how do we get it?

stopthinksecure - November 1, 2013, 5:38 am

Thanks you it's very helpful
many years for jRAT :)

Goalaaaso - November 1, 2013, 9:02 am

Thanks for the clear tutorial! It helped alot!

Appro?val - November 1, 2013, 10:15 am

Great job! even tho i don't need this tutorial i appreciate how much work you put into this!

Brooklyn - November 1, 2013, 5:16 pm

I've got to say this is the most detailed tutorial I've seen in a while, great job OP.

skulls7 - November 11, 2013, 2:15 am

Awesome step-by-step tut on jrat! I have followed this tut completely but for some reason still cant get jrat to work correctly. I'm probably doing something wrong myself and I've opened a support ticket on the website and PM'd you. Hopefully we get this fixed! Big vouch for these guys! Awesome products!!

Business - November 17, 2013, 9:42 pm

Hopefully this guide is still working. If anything needs to be updated, let me know.

FrogKing - November 17, 2013, 10:06 pm

I am experiencing really high ping to my slaves regardless of their location. My ports are forwarded correctly and my VPN is working fine. Any reason that would cause 2000+ ms?

Business - November 17, 2013, 10:27 pm

Is your connection very poor usually? Try a speed test website to check your own ping.

FrogKing - November 17, 2013, 10:32 pm

My internet connection itself is fine and it is only a tiny bit slower through my VPN. A speed test has me at 203 ms when done through my VPN

Business - November 17, 2013, 10:48 pm

It can be a problem with their internet sometimes also, but it should not be that bad for everyone. Try without the VPN, because in my experience they slow things down greatly.

FrogKing - November 17, 2013, 10:54 pm

Unfortunately I can't port forward without my VPN, but I'll made do with what I have .

Thanks Business!

Hi! Thank you for this tutorial!

(First of all I'm French so maybe my English is not correct, anyway I hope you can understand my questions ^^)

1 I've contacted with my ISP because I can't open the ports... (maybe I opened them but I get error on <http://www.canyouseeme.org/> even with 80) I opened the ports on the windows firewall and also in my antivirus (ESET) I've opened other ports in the same form and they works well. What should I do?

2 I made a server.exe and server.jar I think I need the .jar right?

3 How can I know if the server works? I've read that with sandbox but it doesn't works... and also with java -jar but I don't know how to do it

Can you help me? Maybe by PM me or skype as you want. Thank you!

tahareal - November 22, 2013, 8:18 am

thank you so much , its working perfectly :*

dread5000 - November 29, 2013, 11:14 am

I paid and sent a message and no response,what's the deal?

Treeple - November 30, 2013, 2:45 am

What is the difference between the free and the paid version? First post says the paid version has webcam and keylogger function, but you also have complete access to JRAT when you pay. What full access? Only those two options?

(Nov 29, 2013 12:14 PM)dread5000 Wrote: [\[CITE\]](#) I paid and sent a message and no response,what's the deal?

It seems they have had problems accepting paypal.

Woah, so well-explained tutorial. Props.

sasami_327 - November 30, 2013, 2:54 am

Good Tutorial! :)

Thanks ?usiness!

No Honor - November 30, 2013, 11:54 pm

I have the money to purchase this rite now. Can somebody connect to me on teamviewer an help me buy this product and set it up? Willing to pay you 5\$ to Help! (If Need) Please pm me ASAP

My payment went through and no response at all. What the hell>?

anoutlaw - December 14, 2013, 2:11 pm

I sent 2 email at <http://jrat.pro/support.php> but have not received a reply, really want to make payment so maybe you can check email id 403 :)

Sexy??? - December 14, 2013, 2:12 pm

Jrat is a very good RAT, I use it to this day, nice tutorial man!

elsujeto - December 21, 2013, 2:27 pm

Hi! Client.jar is not working on my mac 10.6.8. Any possible solution?

Thanks in advance

Business - May 31, 2014, 12:52 pm

Someone working with Red on jRAT should release a new tutorial, one that is updated and what not.
