Thread: [Question about Moving Website](#)

RoLLs Ro?CE - September 9, 2013, 7:32 am

Recently i have moved to a new hosting company which i got for free, previously i was with Godaddy and they where really bad, so i entered the Nameserver and such in the Godaddy website, but my website still does not show up when i enter the url, it gives me an error

Apache/2.2.25 (Unix) mod_ssl/2.2.25 OpenSSL/1.0.0-fips mod_auth_passthrough/2.1
mod_bwlimited/1.4 FrontPage/5.0.2.2635

Anyone know how to move the entire website?

I'm really noob to all this and the resolution is probably something straight forward.

Thanks.

I can help you with this but if you would like you can also use an ftp client like firezilla (or any other.) Also what is your website currently? Is it a forum? Because you can generate a back up to restore once you move to a different host if it is. Also if you have already changed your name servers to your domain you might have to use the ip that the domain has and the user name to view the website.

If my website domain was 123.45.678.90 and my account name was punisher I would be able to check my website by going to the link below

<http://123.45.678.90/~punisher/>

It can take a few days for the nameserver changes to take effect.

Is it a problem that i used the Godaddy website builder to make the website? Also, i have tried going to the Websites IP but it still gives me the same error.

I've got cPanel with this new hosting now, is it something to do with that?
