Thread: [Admin page finder, directories listing \(Kali Linux\)](#)

azihak - September 11, 2013, 2:01 pm

Hi ?

I would like to tell you about an awesome tool that comes with Kali Linux. DIRBUSTER

This tool is a crawler that can find directories and files hidden by website admins through brute-force. Can find admin pages, hidden pages, hidden directories, etc.

So I made a small and simple tutorial about it. Hope you like it ?

--

First open tool, it's in Applications->Kali Linux->Web applications->Web crawlers->dirbuster

Spoiler [\(Click to View\)](#)

next we advance to the scan

Spoiler [\(Click to View\)](#)

- (1) insert website to scan and choose number of threads (how good is your machine?)
- (2) in this example I used a name list. don't worry, there's some lists in `usr/share/dirbuster/wordlists`. just choose one that best fits you.
- (3) Select your options here. if you point mouse above each option, you'll get more info about them

now we click start and wait for results

Spoiler [\(Click to View\)](#)

Spoiler [\(Click to View\)](#)

DONE ?

NOTES: Keep in mind that the success of this method depends on the name list. you can make or download better ones or use pure brute-force

?

I was looking for admin panel finder in Kali. Finally, I've found it.

(Old thread but gold for me :D)
