Thread: [GUIDE ME GUYS :\)](#)

Ð????c???? ?ø??? - October 4, 2013, 4:52 pm

OK .. that's the case, i am a student in a stupid university which doesn't allow all of the students to know their grades and scores at the end of the educational year because of some financial problems with them.

so i want a way to make me able to hack on their wifi and be on their network to get the scores for my mates and spread it out and apply revenge on the greed in my university ?

well i know some basics .. like :

i need to work on a BT5R3 or KALI

i need wireless adapter like [THIS](#)

i need to their website maybe !

so please guys feel free to tell me all what it needs me to do please ?

They probably have a completely different and isolated network for grades. Nobody would put wifi on the same network as important records.

Ð????c???? ?ø??? - October 4, 2013, 10:48 pm

hmm i made some searches and found that there's a different between hacking a wifi and hacking the network on this wifi

now am more concerned on hacking the network containing the results

yet i didn't stop there also .. i thought about ratting a single PC on this network but i need a way to infect the PC having the "target" so, is there's a way to make a trojan infect the WHOLE network from single PC been infected by a USB for example ?

thanks in advance ?

if the wifi is WEP then you can crack it easily even in windows but if it is WPA there is a chance to crack its password using reaver which is in backtrack

There is no single method that works for all networks / systems. It's a case by case type of thing. If there was one way to do it, everyone would be hacking everything and there would be no point in real hackers going through years of practice and fail to get where they are today. If a person found a way that worked on every network, they wouldn't just share the method to people who want a free ride.

Considering that you're also straight up asking how to do something highly illegal in a public forum You probably shouldn't expect much.

Try to ask questions that we can answer without being an accomplice. Hypothetically, you do your work until your stuck and then ask us a question like, "are there any vulnerabilities of active directory?", or "how easy would it be for a noob to read encrypted data". Those are questions we could answer and you could work with. In any case, you'll have to make extensive use of your thinker.

?? raising a hat is just not enough but it's the highest thing to express my gratitude ..
i will follow your advice .. i will search more about it to know all what i can and start asking more specific questions ?

thanks in the all mean of the word my friend .. ??
