Thread: [How to capture a Captcha from a site? \(dynamic images\)](#)

Anne - October 14, 2013, 6:40 am

Hi coders.

I have run in to a problem that I bet some of you have faced. Getting a hold on/reference to a captcha.

It isn't very difficult for the ReCaptcha by Google, because they have static images, where you just need to capture the image link.

However, have any of you tried getting the pictures in SolveMedia captchas?
I simply cannot find a way to do so myself and therefore need help from better coders!

Here's an example of how they look: <http://solvemedia.com/publishers/captcha-type-in>

You can take a look at both of them (profit & non-profit) but they work similarly.

Let me know if did not understand the question and I will rephrase it.

Here it is in short:

How do you get a link/reference to a SolveMedia captcha image, so you can use it with DeathByCaptcha or similar sites, or just save the image on your computer for later?

I am also looking for this... Anyone can help ???

stugz - November 26, 2014, 3:59 am

It relies on Javascript. Your agent or browser needs to be able to execute Javascript or these types of captchas don't display the image. It is part of the extra security these types of services usually use to market themselves.

Recaptcha security works a different way. Too many requests from one IP address for Recaptcha images leads to ever harder captchas until they ban your IP address for some hours.

how to fetch the captchas using webbrowser ???

XSpashx - November 27, 2014, 1:30 am

I found a tutorial on a website but can't post link because of post count, PM me

???

Selenium, Watir or similar will do the job.

How bout using your brain - *November 27, 2014, 8:44 am*

This is the exact same question I have answered here:
