Plugin Example [Source]

[Download](#)

View the readme for instructions on making it work correctly without errors.

Not very HQ, making this quick. This is 90% my code. I used the GenericPluginLoader class found via the googles. (Credits and license are within the "GPLoader.cs" file)

It allows someone (using this setup here) to create an independent theme and use it throughout the form.

I don't see you trying to provide to the community for a plugin system. This was just an example. If i wanted to do a full on tutorial, then yes I would do it much more efficiently and effectively.

posting it and giving bad example is not so good for ppl want to learn

ur code too complicated when can be done much easy without the class u found on google
