Thread: [\[Tutorial\] Official Blackshades HTTP Setup Guide \[Tutorial\]](#)

Dot Mp5 - November 7, 2013, 8:40 am

Welcome to the Official Blackshades HTTP Setup Guide

Today i will be showing you all how to setup the Blackshades HTTP botnet. For some of you who are unsure of what the Blackshades HTTP bot is, it is an online panel in which you can spread your "virus" around just like a R.A.T (Remote Administration Tool). The thing that is a little bit different and what most prefer over a basic R.A.T is that it is all accessed online through a domain name.

So lets get started!! (p.s screen shots are in spoilers)

If you don't have hosting or a domain i recommend going to www.SPAM.com which will provide a free domain and basic hosting. If you plan on expanding your botnet to larger numbers like over 1000 or so i would fully recommend getting a paid domain and host. But for the purpose of this tutorial we will just be using SPAM.

Spoiler [\(Click to View\)](#)

Then go ahead and sign up

Spoiler [\(Click to View\)](#)

Choose a free subdomain and then finish up making an account with your name, email, password, and then entering the captcha.

The next step is to go and login on bshades.eu and download the php files, these will be located under your account services if you have already purchased them, if not go to <http://bshades.eu/products.php> and select HTTP and then purchase. Compared to other HTTP bots which cost hundreds, this is very cheap, well supported, and has a lot of features!

After you purchase go to your User CP and then click on "My Services" and then click on "Download HTTP Web Files"

Spoiler [\(Click to View\)](#)

This will then give you a torrent file to download, i personally recommend using utorrent to download this but others will work as well (www.utorrent.com)

After it is all finished downloading upload them to your cpanel in the "File Manager" in "public_html" and then in here you can chose to give your net a different path or keep it on the base of the page, for this example I'm going to be putting them in the path /test, If you prefer you can upload them

through an FTP client, i personally use File Zilla. In here to setup your net as a site the info you will input is

Host - your domain provided by SPAM

Logon Type - Normal

User - Username given by SPAM

Password - Your password used when signing up

Spoiler [\(Click to View\)](#)

Copy all the web files you downloaded into your path on your FTP client and wait for them to finish uploading

Spoiler [\(Click to View\)](#)

Now that thats all done with its time to make a MySQL Database!

Go into your CPanel again on your host and then select MySQL

Spoiler [\(Click to View\)](#)

In here make a MySQL database but entering the forum

MySQL database name - anything you want

MySQL user name - anything you want

password - something hard to just guess

Spoiler [\(Click to View\)](#)

After you fill it out it will give you this

```
$mysql_host = "mysql3.SPAM.com";
```

```
$mysql_database = "a5376159_tut";
```

```
$mysql_user = "a5376159_tut";
```

```
$mysql_password = "Password";
```

Copy this down you will need it!

Now go into your FTP client again and go to the file config.php

Spoiler [\(Click to View\)](#)

Edit this file and put in the info you got from your mySQL setup

Spoiler [\(Click to View\)](#)

Save the file and reupload

Next step is now to go to www.yourdomain.com/path/install.php

if you didnt use a path then just go to your domain.com/install.php

You should see this page, now chose a username and password

Spoiler [\(Click to View\)](#)

click install, and then it should install

YAY!!!! you finished the main part of getting it setup!

Now its time to get your bin file to start spreading!

Go back to your user cp on bshades.eu and then again to "My Services"

this time click on "Build HTTP"

Spoiler [\(Click to View\)](#)

12 build.png

In here edit your binary, i would leave the connection, command, and network interval as default and the rest you can change to what you would like for the startup.

Spoiler [\(Click to View\)](#)

Click on compile and download your bin!

Spread your bin and you are good to go! enjoy your incredible new bonnet!

If you have any questions feel free to PM me or if you have purchased the net submit a ticket through your Cpanel!

For any questions on Blackshades products contact me aswell!

Hope this was helpful!

No comments guys common this is a create tut if I could I would rate this and give you a 3+ rep :)

rarebone - November 7, 2013, 9:33 am

Nice guide, thank you very much bro :)

Dot Mp5 - November 7, 2013, 8:36 pm

Thanks guys! worked hard on this, dont forget if anyone needs help with any of the Blackshades products just contact me through PM! more tutorials to come!

GhostFuus - November 8, 2013, 5:12 am

Thanks , Good tut - easy to follow steps but i dont suggest using free hosting!

Me neither, I recommend if you are going to actually commit to this but hosting don't use free

Stev - November 8, 2013, 9:36 am

A very nice tutorial Dot Mp5, thank you for helping the members out.
