Thread: [Semi - Advanced Resolver \[v1\]](#)

iFruity - November 21, 2013, 4:55 pm

Well I coded this earlier it's ok I'd say. I coded this in 20 or 30 mins trying to make it "advanced" but now its complete and maybe some of you would learn something?

I don't give 2 fucks about your opinion so don't waste your time. This is mostly just for newbies at .net and looking to learn from sources. Features

- Skype Resolver
- Custom API
- Design Settings [Context Menu]
- Noob Friendly
- Neat Source

No I did not implant an api for every to use, you must put your own in the source! ?

Ok for newbies only eh? Lets start off by turning strict on. On wait here comes errors. Since when was an integer a boolean? Why are you comparing boolean to true or false? Do you understand the difference between subs and functions? Err hello modifiers you know what they are? errohandlecheck? it sets a fucking labels text and forecolor. wtf this got to do with EXCEPTION HANDLING. why are you using olb vb fucntions like vbnewline? You wrap try statements around code that cant even fucking throw any exception.

you have the nerve to say newbie, and guess what. you're worse then a new coder. Because you are fucking piss poor.

OP. Don't be butthurt. Use ident's post to learn from, and correct your mistakes.

Cesar Morales - November 21, 2013, 9:11 pm

Looks pretty good, OP. As always, a lot of people here on HF aren't always nice about their opinions... do the best you can to take only the constructive-criticism, rather than the negativity they invoke into their posts.

Nice job though, keep up the good work.

@Ident: OK man, it's seriously time for you to stop arguing about Strict On(I stated millions of times why). And about the rest you are 100% right.

@PatPositron: Congrats man, I'll hit 1000 soon :D
