Thread: [PHP Coder to code new features to my Booter Source !](#)

Repentant - November 24, 2013, 9:41 am

I am looking for some one who can code "PHP" and code me a few things on my current booter source.

Here's the list of things I want added:

Code - Custom Captcha on the registration page

[IE: 5 + 2 = ?]

- BitCoin AutoBuy

- Charts showing Money made today and weekly made and monthly made.

- Rotation System, my booter works with cURL but I would like If you could add a feature on the admin panel where I can add servers directly instead of just "API Links", my API script and my boot.php both have stop attack enabled, and it uses screen and \$cust IE:

`http://google.com/send.php?host=[host]&port=[port]&time=[time]&method=STOP&cust=test`

That's to stop the attacks, but I would want for you to code me a feature where I can add servers directly kinda like fsock with rotation system since I have 4 servers I would want one server to attack then once another member makes an attack it will attack with another server I added, so on...

- On the boot page , show running attacks and when will it be done and a feature to stop the attack like TwBooter source, it will show running attacks and an option to stop the attack.

- Forgot Password feature [If possible]

rooted. - November 24, 2013, 11:12 am

Hey, im interested in this

I email right now.

King of Hearts - November 24, 2013, 12:03 pm

Hey,

I am experienced with php and can add the features you'd like to your booter source. However, I don't understand the rotation system. Can you please explain that a bit more?

Thanks
