Thread: [nstream, client not closing in my program.](#)

Moon Rock - December 6, 2013, 10:48 am

So I have a remote desktop view program and it'll start, but once you click stop on the client side it'll stop. Later once you want to view them again you connect... you press start and the program crashes. So I stop and view were the code it at on the client and it's here.

```
Code While client.Connected = True
    nstream = client.GetStream
    PictureBox1.Image = bf.Deserialize(nstream)
End While
```

So the server side isn't closing it's connection from the last session. How do I close it?

Code the server uses to send images.

```
Code If Not client.Connected Then
    client.Connect("192.168.1.66", port2)
End If
thread2 = New Thread(AddressOf TMR)
thread2.Start()
```

```
Code Public Sub TMR()
    Try
        T.Start()
    Catch ex As Exception
    End Try
End Sub
```

```
Code Sub TElapsed() Handles T.Elapsed
    SendImage()
End Sub
```

```
Code Private Sub SendImage()
    Dim bf As New BinaryFormatter
    nstream = client.GetStream
    bf.Serialize(nstream, Desktop())
End Sub
```
