Thread: [Android x86 Vm , internet connected but the device wifi doesnt recognize it](#)

randvoo12 - December 6, 2013, 11:51 am

i installed Android VM on vbox and vmware workstation , both , i followed a tutorial online to be able to solve the famous internet connection problem , and finally i was able to make persistent ethernet connection, so now everytime i run the virtual machine i am able to use the internet from the browser but still the device wifi can't recognize its connected , i shouldn't care about that , right ? wrong , everytime i try to add a google account , to access the google store or make any update , it can't sense the ethernet connection so it prompts me for the wifi screen which cant be turned on , so even though i have internet the system can't recognize it and i still can't use the VM , i wouldn't have asked if i found any solution on any place on the internet , so any ideas? it doesnt have to make the wifi work , if the ethernet can be emulated as 3g i think this might work , but i don't know how to do that , especially i cant download or add any application to the system without the google store , and also am new to android , my host is kali linux 64 bit , and i have eclipse and sdk tools but have no clue about how to use them , thanx
