Thread: [Comment Spammer for a Facebook Comment Box](#)

DogTired - December 14, 2013, 3:38 am

Hey Folks! :)

At the moment I'm learning VB.Net and wanted to start a little project for a beginner, then suddenly a gaming website organized a PS4 and they want to give it to someone! :) :D

But here are their rules:

Code ...YEP! NO RULES! :D Just the last comment at a ungiven time will win :)

So I wanted to make a comment bot, just a little spammer.

I tried with a normal spammer with the Keyboard.SendKeys and SendKeys.send("{ENTER}") because normally if I press ENTER the comment will be posted, but the problem is a normal ENTER doesn't post the comment, I have to press a button.

[img]http://i1278.photobucket.com/albums/y519/DaBootO/HF_zpscfa66bd.jpg[/img]

So I know there was a tutorial somewhere on the web about HTML/PHP Form using through VB but I can't find it anymore -.-

I found [this](#). But it's a bit confusing for me now because I'm a beginner :(

I thought of either making a simple GUI like textbox thingee just with the START and STOP Button and a Text Box and then go into my Chrome or Firefox Webbrowser and let it do his job, OR I could make a little Webbrowser inside VB.Net and then go to the webpage and let it does his Job from there on.

So what do you think? What is better? And could you give me maybe a tip on how to solve the problem with the Submit/"Kommentieren" Button? :)

Regards

have you tried using tamper data to see where the post gets sent? you can probably see where and with what POST or GET tags.

If you find this out you can use httpwebrequests to send the message..

Thx :)

Just started Kali to look for the POST request :)

I will tell you whether I can find it :)

EDIT:

Looks like the webpage uses then Facebook to comment. When I press Comment there is a request send to FB and the command "comment". I think it would be easier to use another method, don't you think so?

you need to find a way to change the comment_text paramater but you will have to find out what the other parameters use so you don't get banned. Yes browser is easier but you will learn more and it'll be more efficient with httpwebrequest

Hmm... I'm much more familiar with Python, so when I use the HTTP lib I'm gonna use python. Should also work :)

Thx for your help :)

:D Hab mir irgendwie schon gedacht das irgendein deutscher das hier sieht

Machste auch mit bei der PS4?

You can code that in literally 10 lines of code with a webbrowser.

Yep, thanks :)

But would you be so kind and help me with the code? :)
