Thread: [remotely access a pc without them knowing?](#)

nepalikto - December 18, 2013, 6:52 pm

Hey hf whats up?

I just wanted to know if i could jse someones pc remotely without them knowing?

I know its possible but i donk know how

Ghanks in advance fkr the tug

Understalker - December 18, 2013, 6:52 pm

Yes, this is called a "RAT", also known as a Remote Admin Tool.

Check out my signature if you need help.

Zabuza? - December 18, 2013, 9:03 pm

It's not really possible unless they have literally no security on their computer. Now as mentioned by Understalker you could get a RAT or as he mentioned a Remote Administration Trojan, where you can control the computer remotely, though in order to achieve that you need to get them to download a stub, so basically you need them to download a file.

rahoool - December 19, 2013, 1:43 am

you can use smb08_net api vulnerability in windows xp machine try finding one using shodan search but remember i am not demoralizing you but finding this vulnerability is quite rare but heyy good luck...

Kirian - December 19, 2013, 3:20 am

If you are going to pursue RAtIng as suggested by Understalking, I have provided you with some RAT tools.

A RAT (Remote Application Tool) is a great way of gaining access to a victim's computer. You have to make a stub and send them a file & they have to execute it. Here are a few example's of programs to make RAT's:

[DarkComet](#) - Free & very useful. Would recommend if you have no money. Recommended

[jRAT](#) - \$40, a good RAT tool. If you have a decent amount of money, I would recommend this. Recommended

[legacyLink](#) - \$50.00, has fast speed when capturing Remote Desktop, which would make it easier to control slave's computer. Recommended

Getting them to download the file and running it not big a deal i can get them to do this
