Thread: [\[VB.NET\]Adding Log File](#)

codepoet - April 30, 2010, 9:29 am

Code Sub Log(ByVal txt As String)

'Open a file for writing

Dim FILENAME As String = Server.MapPath("Log.txt")

Get a StreamReader class that can be used to read the file

Dim objStreamWriter As StreamWriter

objStreamWriter = File.AppendText(FILENAME)

objStreamWriter.WriteLine(DateTime.Now.ToString() + " >> " + txt)

'Close the stream

objStreamWriter.Close()

End Sub

Rewritten by me from VB6

Little amelioration

Code Private Function Log(ByVal sFile As String, ByVal sText As String)

Dim objStreamWriter As System.IO.StreamWriter

objStreamWriter = System.IO.File.AppendText(Application.StartupPath & "\" + sFile)

objStreamWriter.WriteLine(DateTime.Now.ToString() + " >> " + sText)

objStreamWriter.Close()

Return Nothing

End Function

Example:

Code Log("logs.txt", "Application started !")

Very good snippet !

Nice man..

Excellent for people that likes to make their applications a bit more special.

Thanks for sharing mate.
