Thread: [Getting IP/Information about user behind Gmail Address](#)

SIM-964740 - December 26, 2013, 4:08 am

Hello, I am inquiring whether it is at all possible to get the users IP from an email sent from the Gmail webclient. I know how to get the IP if it has been sent from a external client however that is no use in this case. So any ideas guys?

You're going to have to send an IP logger, one that originates from whatstheirip.com, but really any logger should suffice. That's really your only option(that I can think of right now)

As suggested, send an email with an iplogger inside and use a title and an address that can make target open it.

Here's a link: <http://#/>
