Thread: [Make mail go into inbox and not junk/spam folder](#)

Mad Hatter - January 9, 2014, 8:33 pm

Hi I am sending an email from a program I made and it keeps getting sent into the spam folder. Can I mess with the settings of the email to ensure it gets put in the inbox like the header, Cc, Bcc or anything like that?

Terry A. Davis - January 9, 2014, 8:35 pm

Nope.

You will need to use another email provider, as the one the program is using has been flagged as spam, or maybe change your message as well.

If that fails maybe try send it from an email you made manually. That should go to the inbox.

What language are you coding in? (probably should post in the proper coding section)

That wouldn't matter, what matters is the address and interval your sending them from in my time when I used to spam emails

You are half correct, It could be the recipient's ISP/email provider, It could be the standards aren't met (SSL), it could be the message is , could be a lot of things

I was asking so I could possibly help with the code for it, depending on what language they are using.

I actually does matter if he's sending out crippled messages that barely conform to standards, meaning that without having seen the actual code, it could be pretty much anything.

Mad Hatter - January 11, 2014, 8:04 am

I'm actually spoofing the email and when I spoof it, that is the only time it goes into the spam box
