Thread: [Darkcomet Rat issue](#)

spawn303 - January 12, 2014, 4:32 am

Hi All.

I used an crypted version of DarkComet RAT (I crypted it with and crypter I bought here). However I have the issue that my "victim" dont show.

I know the RAT is installed
I have forwarded port 1604 in victims router
I have done the same in my router
I have the no-ip DUC running and testet with canyouseeme.org

He still dont tick in, I'm sure it's not the RAT or crypter coz earlier I installed an hidden FTP server on his PC, I know it's allowed in his firewall

but after reboot it's nit running anymore.

He uses Avast for protecting his PC, I have the feeling that AVAST catches the startup and unathoirized connections, coz it keeps failing when I try to RAT his PC.

Im very sure the port forwarding is working okay.

Is there an other bulletproff RAT I can use instead?

Or does anyone has some experince with Avast?

Uhm I never seen this before man all my slaves / bots always work an like half of them use Avast.

While building your server, did you make sure to turn off all options? Also, did you make sure to enable start up and persistence on the CRYPTER when crypting the file?

If so, then the most likely issue (since it looks like you can see the slave online prior to a restart) is that Avast is finding and deleting your server and this would mean that your crypter is not FUD.

If you need further help, please feel free to PM me and I will be happy to help you over TV.

As above said, you cannot have any options enabled when creating your server - as it will corrupt it when you crypt it.

All you should do is put in your No-IP and Port & Build the server as UPX.
Then crypt it using the correct settings, Let me know if this works.

I went over the settings again, Im sure I did it right.

The crypter handles all the persistence and startup, I left all this out in DC.

I'm 110% sure the port forwarding works - There must be something on target PC other than Avast then that blocks it.

I tested with avast just now on my test laptop, it sure is FUD, no problem there.

The more I test , the more sure am I that the RAT is fine and so is the crypter, coz I tried before to sneak in an FTP server
and that one got blocked too after he rebooted.

it's a windows 7 PC 64 bit, for what I know installed with Avast and stadard windows firewall.
it shouldnt be rocketscience - so that's why I'm sure there must be something else on that PC blocking

Is there a better RAT for the job ?
