Thread: [\[REVIEW\] A review of the SDLaser 303 Green Laser Pointer](#)

phybe? Jr. - January 19, 2014, 5:45 pm

I got this laser pointer last summer during my trip to China for 100 Yuan, or 16.53 USD. I've seen the same laser online (same name, same look) for about \$27 on DX.com.

This is what comes up when you search it: <http://dx.com/s/sd303>

This laser is fairly powerful, but not that good for burning.

Here's my review:

Spoiler ([Click to View](#))

The SDLaser 303 comes in a neat little box. It has a magnet latch and can be used as the laser's "carrying case."

Inside the box, there is a little foam cut out that is shaped to fit the contents. It's not the best, but it works.

What you get: In the box, you get 6 things.

2 Keys: These are just basic keys, they prevent the laser from turning on if locked.

1 Laser: It's a laser pointer. Made of a sturdy feeling metal.

1 Kaleidoscope-like starry lens: You'll see in the pictures. It's hard to explain.

1 Battery: Basic rechargeable battery. Lasts a good while, I was surprised.

1 Wall Charger: You slide the battery onto it and charge it.

The laser itself is fairly well built. It's made out of metal and it has a nice solid feel to it.

The tip of it can be screwed in and out, focusing it. It also has a slot where you can screw in the starry lens.

The keyhole is pretty high quality, and clicks when you turn it. It disables the On button when locked. (Good if there are young children in the household!)

The key itself is okay. It isn't very solid, but gets the job done.

This is what the normal beam looks like: (My battery isn't full, so a full charge will be a little brighter.)

And this is what the Starry lens I've been talking about does:

You can twist it, making it change its shapes. It's super cool.

Thanks for reading!

Of course it's not good for burning, it's 5mW

Try 200+ for burning

This looks pretty cool and was a nice quality review.

I may consider buying a laser such as this one at some point in the future.
