Thread: [Panda Cloud Infrastructure](#)

vasileios - February 19, 2014, 7:14 am

I would like to learn about Cloud Infrastructure that is used by many a/v companies, such as Panda...

Any ideas/knowledge about this? For example, Panda: how many servers use? A home cloud server that is consisted of virtual subservers? Each computer in the cloud is connected 24/7 to a virtual subserver? And the analysis of the files, where takes part in? In the subserver?

Some questions can easily be answered by a quick Google search buddy

Thank you Aura! I have read this article and many others, but i can't find information about the hardware infrastructure that there is in the cloud. All articles refer the cloud as something general and they don't say something about the inside infrastructure... For example, how many servers, subservers, their hardware characteristics, etc?

Well, I guess that Cloud Antiviruses are composed of the same infrastructure offered by many cloud provider like Amazon (EC2 for exemple). Maybe Chief knows the answer to that question.
