Alert for: All iPhone devices without the iOS 7.0.6 patch

Vulnerabilities: CVE-2014-1266

Update: Go to Settings app > General > Software Update

Information:

Apple's latest 35.4 MB update of iOS 7.0.6 doesn't seem important at first, but it contains a critical security patch that addresses a flaw with SSL encryption.

Yes, a very critical security vulnerability that could allow hackers to intercept email and other communications that are meant to be encrypted in iPhone, iPad and Mac computer.

The vulnerability assigned CVE-2014-1266 and affects both the iOS and OS X operating systems, describes as 'Secure Transport failed to validate the authenticity of the connection. This issue was addressed by restoring missing validation steps.' in other words, anyone with a certificate signed by a "trusted CA" can perform Man-in-the-middle (MITM) attack.
