Thread: [Chipset fan loud! Need help](#)

imahich2 - February 23, 2014, 10:22 am

How do i turn this damn thing down i don't wana turn it off i can't find it in the bios i have a x79 extreme 11

archangel.dmitry - February 23, 2014, 1:52 pm

There is not much you can do. The board is known to be a bit noisy. If you are running on stock frequency, disconnect the fan and monitor the temperature of the board.

Xult - February 24, 2014, 8:28 pm

What I would recommend is to search Newegg.com for a good deal on a more quiet fan to suit you. Otherwise if your fan is loud check it for dust because usually the fan will try to work harder heating up faster with dust on it. If you do have dust buy Canned Air to blow this dust off the fan and it should work better. But once again if your fan is just loud go to option 1 and just purchase a new one if it really bothers you.

DataSaurusHex - February 24, 2014, 9:06 pm

WD-40 should help. bit of sparkle to it and is good

Anshuman - February 27, 2014, 12:34 am

You just have to get a new fan which do not produce that much sound. Check out ebay.in or your local stores.

apetrov - February 27, 2014, 12:52 am

Machine oil and perhaps a dust cleaner can do miracles. That is if the fan is old and used for a couple of months.

m4gnumsnip3r - February 27, 2014, 10:32 am

I would rather leave the fan noisy if it keeps the system cool.

If you want to turn down fans then your best option is to download Speedfan.

It will let you control your fan speeds. I have a similar problem with a fan. I reduce the speed of the fan from 100% to around 40 or 50% and it works wonders.
