Thread: [Computer book recommendations](#)

lostsoul1771 - February 27, 2014, 6:28 am

hey guys i dont know alot but i would love to learn how to hack. any computer books to help me build a foundation on how computers / networking works !

Mwwaaaahh44 - February 27, 2014, 6:40 am

Hey,

For some inspiration i would read "Ghost in the wires" :D

I'm not farming comments btw, I just love this book! As i imagine 99.9% of us do too.

You should look into what kind of action you would like to perform. I haven't read any books, but I'm on a long road into the world of hacking. What I suggest you to do as a beginner is to learn about RAting, such as Dark Comet RAT, and move onto learning hacking languages, JAVA, HTML, C#, C++ and so on. You can find guides and answers on almost all your hacking needs here on Hack Forums, no need to buy a book for it. ?

Well i want to built a worm that background downloads a bruteforce attack off a webpage at late hours and brute forces any wifis and goes onto those wifis and spreads itself searching for kiddie porn then over heats there cpus and break there computers O.O
is that illegal ?

Yes it is but you can see it as a greyhat action.

However the police won't think about that this way...

These are a couple of my favorites for learning from scratch. These are generally good for beginners although pretty dry like most hacking books. I have some suggestions for more advanced books as well if you want those. As a disclaimer though: you could read these 1000 times and learn nothing if you don't have a grasp on coding.

You'll need a password list to be downloaded with said "worm", and if they have a slow connection, it's going to be a little bit of a problem.

Also, if the neighboring WIFI connections have changed their default router password, it's going to take a long time. You might want to look into GPU based cracking of WPA/WPA2 passwords.

Search: Pyrit.

How are you going to search for these images/videos/etc? By keyword or are you actually going to have remote access to the computer and search yourself?

This is a bad idea, you should leave it to the law enforcement agencies if you ask me.

As for overheating; you will need to change the bios settings if I am correct by changing the fan speed, voltage settings, etc. Otherwise the system will just shut down if it gets too hot and then it will be fine after a few minutes/hours.
