Visual Network

This tool helps you visually map out a network(s) by giving you the ability to add images (workstation, server, router/switch/hub, WWW) move them anywhere and add text information to them. This is not only useful for individuals and administrators, but also for pentesters who want to lay out target machines in a rich, quick and easy environment to discuss it with their team. You can add hundreds of objects and print the visual network for reference, which can also be good to show a client.

Nobody tried this out? would appreciate some feedback for improvements etc.

tty666 - March 29, 2014, 9:16 am

uh no but there is Visio to do this ...

True but that is a paid (expensive) MS product, you can obviously get cracked but that's not the point. This is a simple striped down version I suppose to create network infrastructure charts in minutes and serves a purpose.

With most products there is something similar or alternative, so your reply is pretty pointless really.
