Thread: [hacking with idevices](#)

heinrichhimler - April 8, 2014, 1:40 pm

Hello there just wanted to show you some cool stuff with idevices. Dint have much time to make so pm me with your questions. You will need to know a little linux to really get used to it.

First thing first you must be jailbrocken. I suggest using envasi0n.

Downloads- [MAC](#)

[Windows](#)

Jailbrake will only work on devices running ios 7 to 7.0.6

So once you have jailbrocken make sure you are switched to developer mode. Then you must add a source called ininjas.

Repo- [Repo url](#)

After you add it "takes a long time, ignore errors" download the majority of the packages listed. This will take up allot of space! Then you will notice you have a mobile terminal icon on you springboard click it. Now type in su "gives admin permissions" Then for password it should just be alpine. Then after that you can launch what ever hacking tool you downloaded from the ininjas repo. You will need to change the directory for most programs so use the cd command. ex: cd pentest/exploits/ When you find the program you want to run and your in the write directory just type ./ "program" But say you downloaded iAHT you don't need to run anything besides admin permissions so just type iAHT. "iAHT is my faveroute program recommend it. You can get set and metasploit to so basically kali on your idevice.

Thanks for reading sorry i didn't have much time. Pm me questions!
