Thread: [Mass Emailer](#)

ThePsychoCoder - April 9, 2014, 10:06 pm

Hey guys so today I got bored and saw some people that were looking for something to send mass emails, so I thought I would make a quick one and see if people liked it, then maybe update it and add some more features.

Download Link: [Here](#)

Virus Scan: [Here](#)

Does it use SMTP as usual?

/I mean

Maaaaybe...

It's just the email sending code in a loop, pretty much.

M?estro - April 10, 2014, 7:23 am

Should work on the GUI more, and if it uses SMTP like usual there's tons of these. Would be cool if you did it another way.

iMeetYourMum - April 10, 2014, 9:43 am

No SMTP? God banished those who only allow GMAIL!

So, the design is to rework. And I think it's leak, because it is very simple to perform.

PS: Add a Email Spoofer.

Kavalix - April 10, 2014, 9:47 am

Mhm... SelectedItem.ToString... That's how you select from ComboBoxes!

I dare not look at the code, finding either a code or Leaked is a poorly coded code. At least I think.

Why bother releasing it then? I don't think many PPL here want to see your 3 min contraptions, I think you know that too. And actually, that isn't maybe the best promo for your site... "psychonation.net, it's where our programs are sloppy and coded in 3 mins, welcome".

But instead of just HC flaming, if you're just starting out coding now, that's pretty good job. You need to work on the visual looks of the GUI and the code more. Isn't that user-friendly after all.
