Thread: [\[Help\] Struggling to DDOS a Teamspeak](#)

Toddeh - April 12, 2014, 10:57 am

Alright, so i have a stresser, a good one by Netspoof (no i don't want recommendations on which ones are better) but in my experience it's been almost impossible to take down a TS3 server from big companies, although their game servers are easy to hit.

Anyone else know why this may be? anyone else have this issue?

MrTing - April 12, 2014, 11:40 am

Maybe it's because big companies are smart enough to know how to mitigate? Game servers are very different then TS servers.

Goodies - April 12, 2014, 11:43 am

Large companies run large DDoS mitigation techniques. Take it from me because I help with setting them up. ASA Firewalls are very common. Also, Round Robins are a great way to keep access to users via multiple servers. One goes down, another takes its place.

There are dozens of mitigation techniques. Just know that not everything is vulnerable...

AimDrop - April 12, 2014, 12:28 pm

I guess, that they have some kind of redirector turned on, which redirects the most of packets sent, if it cant handle them all :)

Zink - April 12, 2014, 3:05 pm

Maybe your booter is not strong enough to hit it off.

K_Mob007 - August 10, 2014, 8:06 pm

I need to ddos a server as well fast
