Thread: [\[Tutorial\]How To Use Your Hacked Cpanel To Get Many Of Metasploit Targets \[Tutorial\]](#)

xx 0x0 xx - April 15, 2014, 6:03 am

hello HF members at first this tutorial Originally made by

Penetration Tester : Hassan Abd Elaziz

i take credit Just for Translate and get it to HF " _ "

at this tutorial we will know how to make c panels more useful and get some victims using at metasploit project

Requirements :

- MetaSploit Project on (Windows-Linux-Mac)
 - Website Cpanel
 - Static Ip (you can use vpn provide open port)
-

okay now open your [Cpanel] and go to>> [Advanced DNS Zone Editor]
it will show you another page the idea here that we will make Dns Spoofing that mean anyone open the website he will auto redirected to your exploit link.

let's start now Press [Edit] and edit domains not Supdomains

for who dont know what is the difference between domain and supdomain

Domain: www.....com

Supdomain: web.....com

this is just an example

back to our topic now we can edit domains and put your static ip (your exploit link) or [your fake page] then press [Edit Record]

then wait your victims alot of :)

i hope you liked it guys

as i said all credits gos to :

Penetration Tester : Hassan Abd Elaziz

Enjoy guys sorry for my bad grammar XD

i will update it with pics when my connection became better
