How to spread via Torrents!

Hey guys im just sharing a little method i used to use to gain slaves.

First of all, try get a crypter so when you get the slave and they turn off there computer you will still have them if you check startup. I liked getting XBL Accounts and youtube accounts so i always used to name my remote administration tool like "Free 48hr Generator", you can also get a program spoofer what can change like the .exe into a .jpeg etc. But this is not needed for the moment. First of all you need to upload your crypted keylogger/rat, onto some torrent websites. There are many you can upload to just simply google for torrent websites etc. Once you have uploaded your keylogger/rat don't post it 3+ times because it will get reported and took off the site. Just simply upload it once, then download it using a torrent client like BitTorrent or uTorrent. This will seed it and make it look legit, do it around 5 times and you will start receiving slaves. Thanks for reading. ?
