Thread: [\[HELP\] Sending a Virus](#)

L?gic - April 15, 2014, 5:53 pm

Looking for some advice from people who are experienced in attacking targets via sending files. Currently, I am in the position to send files to people who deserve negative outcomes on Skype and was wondering what would you feel is the best thing to send to the target. I understand that I could maybe send a RAT to the target and control their PC however previous testing with RAtIng has failed due to port-forwarding problems.

So, anyone know of any good viruses? I dont really want to send a major virus to crash everything but maybe one which is more irritating? One that could really fuck with them? Give me some ideas of what I could send to the target! ?

Please also consider that I will be sending over Skype, will the virus need FUDing? Is there anything else I could send instead of a virus?

If I could control when the file/virus is activated that would be EXTREMELY HELPFUL! However am sure thats not possible... ?

Also again, the targets I have in mind deserve the worst, trust me! ?

You should still be able to use a RAT. There's a couple of methods you can use to bypass port-forwarding issues. You could try either using bittorrent or utorrent to open the port. If that doesn't work I would suggest that you look into using a vpn that allows port-forwarding.

Yes, as well as find a direct link that does not distribute your file.
