Thread: [Sending a spoofed file undetected](#)

ModernMoney - April 27, 2014, 3:53 am

Hello!

So I have been trying to send spoofed files named sexe.jpg, but when people go to download it, it turns into: "s-gjpg.exe". Does anyone know why? is there another way to send these files?

Niely - April 27, 2014, 4:12 am

What file up-loader do you use? MediaFire?

Have you crypted it? Already tried another spoofer?

I think it is just a problem with your spoofer bro. ;)

bsafhb - April 27, 2014, 4:12 am

How are you sending the files? Mail, Skype etc.. ?

Have you tried putting whatever file you're sending in a rar archive?

i have the same problem,when i make rar the file the inside file change.but i think that you can not change it ,if you try to spread it via mail,it will show the real ending

ModernMoney - April 27, 2014, 4:45 am

Im using sendspace, I tryed over skype, and I tried in a rar, it still shows as a exe and im using the darkcomet spoofer with fileguardian

lordnelsonii - April 27, 2014, 6:15 am

you can spoof it to .scr, it's better

Brado - April 27, 2014, 6:25 am

Yes it can happen.. Or the spoofer you use is not a good one. It can happen that the 'exe' stays in the name, like: filenameexe.jpg

The best thing is to buy a crypted from the marketplace (If you not allready have one) those crypters are really good! And they have all the features you need to make your stub's undetected by your victim's and virusscanners.

Yea I have fileguardian, so I should be using the spoofer in that? whats better about .scr then .exe

An scr file is simply a screensaver file - usually displaying fixed or moving graphics and possibly sound I believe.

For more information you can enter the term "file extensions" and scr into a search engine (like google)

They don't perform the same functions, performance isn't applicable as their purposes are different and you can't use scr files for programs or setup files.

Note this answer is entirely for a Windows OS, it is possible if this is a Mac or Linux environment question the answer may be different...

If you know a little about hacking then you know the scr extension is often used for a rat or keylogger.

calirockerdudeee - April 29, 2014, 5:03 pm

A .scr is far less suspicious, most people won't notice. I'd upload with RGhost too.
