Thread: [Best Mac RAT that can infect Windows too?](#)

FormerlyS - April 28, 2014, 10:21 am

Hello HF, and thanks for taking the time to read my thread.

I want to start ratting, just for fun, but the first thing I need to do that is a RAT (obviously).

So I was wondering, what is a good rat for Mac that can also infect Windows machines? Are there only Java RATs that can do this?

I have used the search button but RAT is shorter than 4 characters and therefore (therefor (?)) cannot be used as search term.

So please recommend me a RAT that meets this conditions.

Also screen/webcam control would be nice.

Thanks again for reading my thread, and another thanks if you help me out.

-TR2000Java rats usually work on mac and linux. Jspy beta is a good free option, you can buy jrat or jhttp.

Thanks but you have to buy the webcam plugin, don't you?

Thanks anyways.

Feel free to post any more suggestions anyone ?.

I believe [Netwire](#) is able to infect cross platform, and is not Java. Although it is a very stable RAT with lots of functions, it is very costly. Particularly for a beginner such as yourself. As previously said, you're better off going for a Java based rat such as jSpy to start off with.

Ok thanks for your help, and I believe that netwire only has a Windows version that can infect Mac too, but the client can't run on Mac.

You can try java based RATs. Example, you can try jspy.

Check this thread it will help you:

jrat should do the trick ...just remember to crypt and bind....and make sure to get it fud ...or else it could be detected by antivirus.

DamienVC - December 13, 2016, 3:30 pm

NetWire if you can work with separate binaries for each OS

If not, use a Java RAT (jSocket if open, jRAT, etc) OSCelestial is pretty dead tbh (java dependencies tho)
