Thread: [Keybase.io \(online GPG encryption/decryption util\) invite giveaway](#)

lillix - May 6, 2014, 1:18 pm

<https://keybase.io> is an online GPG encryption and decryption utility. If you don't know what GPG is, I recommend that you take a look at this page: http://en.wikipedia.org/wiki/GNU_Privacy_Guard and do some research on the GNU project itself. Now what keybase does is manages this GPG utility into one robust package. I currently have 6 invites, originally I had 8, but I have already used 2. I might just use up 4 of the 6 invites and give 2 of them to a friend.

Keybase is still in an alpha stage, so there are SOME bugs, but not that many, so if I do give you an invite and you do register, please do your best to report any bugs that might not be yet patched up.

To get yourself an invite, post here why you want one (you don't have to include things you might not want to) and your e-mail (if you don't post it here and I accept you, I will ask for it in PM, so you don't have to post it in this thread).

Here's my keybase.io account if you feel like tracking me or just generally taking a look (Adam Sterling isn't my real name)
