LordCoder - May 31, 2014, 12:23 pm

I've been reading the thread fully. I checked all the projects and I really didn't know they were there. So although some of them are not as good as Sn0wX wants/he "could" do, I think it's a nice thread to keep updated.
Keep up Karambit.

Auto Proxy looks give only the same proxies everytime.
QuickGif doesn't work right?
Gmail Parser isn't responding on me. :(

All in all, I think I could only try to use the Tibas.

UPDATE 05/06/2014

- Added a program that generates the HTML code of an selfbuild combobox.
All you have to do is to type in some labels you want into the combobox and it will generate it for you :)

Kind regards
Karambit

Heyy thanks for adding that, I've really forgotten it.

Crypt3d_C0d3r - June 7, 2014, 6:50 pm

To all the people who are complaining because they have nothing else to do:

1. STFU and read..
2. The guy who posted these DIDN'T code them.
3. They are sources, not complete projects - use and modify the code for your own uses.
4. If it doesn't work, complaining won't tell the error to GTFO
5. If you DO get an error, guess what.. you can fix the code.. (because you have the source).
6. Don't post if you don't like, find another post in which you do like, then post :).
7. I like this user and you should too because he gave some sources i will use in my later projects!
