Thread: [Obtaining Someones IP Address and Passwords Easily](#)

**SHADELZ-LLL** - May 25, 2014, 12:21 am

Hello HF, Today I'll be showing you how to obtain a persons IP Address and passwords through an info logging link. This isn't hacking, but it can be useful.

## A Quick Explanation of WhatsTheirIP

This will generate a link that when sent to the target, will collect data like their IP, State, City, Postal Code, etc. and send it to an email address.

### STEP 1

Go to [whatstheirip.com](http://whatstheirip.com)

### STEP 2

Fill in your email and click "Get link"

[img]http://s27.postimg.org/j6o9u0q5v/IMG\_20140524\_231629.jpg[/img]

### STEP 3

Copy the link and send it to the target. I usually persuade them by saying it's an article that you want them to read. A fake error page will be displayed. Their info will be gathered and sent to the entered email.

Tip: Use goo.gl URL Shortener to monitor how many times the link has been clicked.

## Obtaining Passwords Through Links:

This will do the same as the IP Stealer, but instead it gathers cached Windows passwords.

### STEP 1

Go to [stealer.ambesty.com](http://stealer.ambesty.com)

### STEP 2

Again, enter your email at the bottom of the page.

### STEP 3

Send the victim the link and coax them into clicking on it. They will be given an error message and asked to run a fake java applet. The passwords will then be sent to the entered email.

Thanks for reading, this was my first ever TuT. Also, Sorry if it's already known information.

Secind trick may be new (or I never heard of it)

The first is called IP looging and it just get the IP and do an IP-Lookup to get that info.

Thanks For Sharing man.

In the second link Java auto blocks the application so I can't retrieve people's passwords.. :/
