Thread: [Problem about cyber gate, virus](#)

Korisnik - May 28, 2014, 7:15 am

Why always avast detects win32 malware-gen when I try to download it? Is it normal. How can I know if it's infected by additioanl r.a.t. Some versions avast didn't recognized as win32 malware gen but differently. Can anyone help? Thank you.

justmatty - May 28, 2014, 7:16 am

Yes, this is normal as it creates viruses so anti-viruses will attempt to block it. To fix this problem, you'll have to disable your antivirus temporarily whilst using it.

-Hyperion - May 28, 2014, 7:16 am

Most av's detect Rat's as a virus you need to either turn off av(not recommended), add exceptions or run it in a VM that has no av

Zelix - May 28, 2014, 7:20 am

Most Remote Administration Tools are recognized as a virus cause they have harmful functions on them.

Disable your antivirus or allow it to be opened.

Ok. Thanks for fast response. So I could pick thies links

<https://hackforums.net/showthread.php?tid=2632776>

becasue they look like good rated. And do is there any big difference between dark comet an cyber gate? I have those links and I will rather pick dark comet. Thank you.

Dark comet is batter than Cybergate as free rat . because its updated . use version 5.3.1F .

Korisnik - May 28, 2014, 8:49 am

Does dark comet has any faulties for ex. like jrat (it shoes icon of jrat on computer which you are hacking). Is there any faulties about dark c., or it is completely invisible?

Anonmoosekaab - May 28, 2014, 8:55 am

In v 5.3.1F, your server is 100% invisible unless you don't use the correct module shield options or you enable show hidden files and system files, except it is visible in task manager and other process utilities such as process explorer, however this is true for almost all RATs.

v 5.4.1F is a team viewer like version that requires the user you are controlling to connect to you first

Korisnik - May 28, 2014, 9:34 am

What is the best tool for the encryption of the file that I'm sending? What does it mean "conect to me first" - does it have to double click it or something like that? Thanks for your efforts.

Fiora - May 28, 2014, 9:50 am

Well all rat files need to be clicked to execute. The 5.4 version of darkcomet will ask for user permission to connect to you. You need a crypter, preferably a paid crypter to avoid detection

Korisnik - May 28, 2014, 10:07 am

OK. Thank you. I will take a look. I've seen some tyna encrypter on youtube tutorial.

her0var - May 28, 2014, 12:18 pm

TS

Did you solve your problems? how?

mine is being detected as well

thinking about switching to another product

Korisnik - May 29, 2014, 4:49 am

I didn't try yet. I don't need it for longer time, just for 2 days. Does anyone know some crypter that is able to do that. Some suggestions? Also, (it's not part of this topic but I will ask) I have registered on SPAM 5 days ago and my account still didn't activated, is it normal to wait so long?

By the way. The hardest thing for me is to make someone activate the exe file. You have to have good idea in which application you should turn it into the exe file you sending, so that someone execute it. You have to know his interests. I beleive that those are ussualy some simple applications or video games or kind of videos etc.
