Thread: [\[OSX\] Logic Pro X Help! ~U63R~](#)

**U63R** - May 30, 2014, 2:25 am

I have been using this program for 1.5 years now.

Here is my soundcloud: <https://soundcloud.com/emtefall>

Write here if you need any kind of Logic help. There will be a lot of questions that I wont be able to answer alone; together we will.

By MiDi you mean keyboard? I have heard that term short for keyboard so I will assume it is. I am using a "Keystation 49es - 49-Key Synth-Action USB Controller".

Yes I have used FL Studio before. Made a song called "Derp" in that program.

Feel free to check it out here: <https://soundcloud.com/emtefall/max-emtefall-derp-original-mix>

I think that Logic has more details and is better if you know how to use it.

But compared to FL.

FL is less complex and easier to get to know. Better for a start.

Is there any way to automate note velocity?

I was looking to score some music for a project I was making but I couldn't do a crescendo because automation is weird as fuck in Logic.

Actually I can not answer this question. You can change the velocity on each note with the velocity tool. The icon is shaped like a "V".

You can also select all notes and change the velocity by holding the V tool in and dragging down/up on one of the notes.

I am really sorry. Hope you will find your a solver for your question.

Thanks. I'll just stick with Ableton for now I guess.
